ABSTRACT. The genus *Glossoloma* (Gesneriaceae; subfamily Gesneroideae; tribe Episcieae) comprises 27 species and occurs from southern Mexico to Panama, northwestern South America, and south to Bolivia. It ranges in elevation from sea level in the Chocó forests of northwestern South America to 3500 meters in the Andean cloud forests of Colombia and Ecuador. The center of diversity of *Glossoloma* is found in the western lowland forests in Ecuador and Colombia, where 15 species occur. The habit ranges from unbranched terrestrial subshrubs and herbs to occasionally facultative epiphytes; two species are obligate epiphytes. Nearly all species of *Glossoloma* have resupinate flowers with laterally compressed tubular corollas that are apically pouched. The generic circumscription of *Glossoloma* is based on phylogenetic analyses of morphological and molecular data from the ribosomal (nrDNA) internal transcribed spacer region (ITS) and the intergenic (*trnH-psbA*) chloroplast spacer region (details of the analyses are published separately). *Glossoloma* includes the majority of species that had been traditionally recognized as *Alloplectus*, a poorly defined genus with discordant elements currently nesting in *Columnea*, *Nematanthus*, *Drymonia*, and the resurrected genus *Crantzia*. Replacing the traditional polyphyletic concept of *Alloplectus* with a monophyletic *Glossoloma* resulted in 21 new combinations, which were published previously. Five new species are proposed: *Glossoloma anomalum*, *G. harlequinoides*, *G. pedunculatum*, *G. scandens*, and *G. subglabrum*. A lectotype is designated for *Alloplectus penduliflorus* (=*Glossoloma penduliflorum*). Full synonymies and descriptions, and a key are provided; all species are mapped, and most are illustrated.

INTRODUCTION

Glossoloma Hanst. represents a well-defined clade of 27 species in tribe Episcieae (Gesneriaceae, subfamily Gesneroideae). The features that define *Glossoloma* are resupinate flowers; an unbranched subshrub habit with terminally clustered leaves; and corollas that are tubular, apically pouched, and appear laterally compressed. The presence of resupinate flowers is a morphological synapomorphy for *Glossoloma*, a previously unreported feature for the members of this group (Clark & Zimmer 2003; Clark et al. 2006).

Most of the species treated here as *Glossoloma* were previously classified as *Alloplectus* Mart. (Clark 2005). The exceptions are the generic type species, *G. tetragonum* and the five species newly described here (*G. anomalum*, *G. harlequinoides*, *G. pedunculatum*, *G. scandens*, and *G. subglabrum*). The recognition of *Glossoloma* as distinct from *Alloplectus* is based on recent phylogenetic analyses of morphological and sequence data from the internal transcribed spacer (ITS) region of 18S-26S nuclear ribosomal DNA and the *trnH-psbA* intergenic spacer region of chloroplast DNA (Clark et al. 2006). A preliminary analysis of limited taxon sampling (Clark & Zimmer 2003) recognized a clade of *Glossoloma* and *Alloplectus*, but there was poor support for the monophyly of these two groups. Additional information from a morphological dataset, the addition of a dataset from the cpDNA *trnH-psbA* intergenic spacer region, and greater taxon sampling support the separation of *Glossoloma* from *Alloplectus*. The generic concepts adopted here are based on an extensive taxon sampling of nearly all species traditionally assigned to *Alloplectus* (including those now recognized in *Crantzia* Scop., *Columnea* L., *Nematanthus* Schrad., *Glossoloma*, and *Drymonia* Mart.); a broad sample of 155 species from all genera of Episcieae, except the monotypic *Lampadaria* Feuillet & L. E. Skog; and an emphasis on large genera, including 37 species of *Drymonia*, 34 species of *Columnea*, 13 species of

Paradrymonia Hanst., 9 species of *Nematanthus*, and 7 species of *Nautilocalyx* Linden ex Hanst. The phylogenetic analysis in Clark et al. (2006) was used to test relationships of taxa classified as *Alloplectus* and to provide an overall tribal-level phylogeny of Episcieae, with the goal of defining and discovering monophyletic groups (see summary in Fig. 2).

Glossoloma occurs from southern Mexico to Panama, northwestern South America, and south to Bolivia (Fig. 1). It ranges in elevation from sea level in the Chocó forests of northwestern South America to 3500 meters in the Andean cloud forests of Colombia and Ecuador. The center of diversity of *Glossoloma* is in the western lowland forests in Ecuador and Colombia where 15 species occur. *Glossoloma* comprises subwoody to herbaceous perennials, which are a conspicuous component of the understory vegetation in transitional forests throughout its range.

MATERIALS AND METHODS

The present study is based on field work in Ecuador (5 years), Panama (1 month), Bolivia (1 month), Venezuela (1 month), and Peru (2 weeks). Over 300 collections were obtained with multiple duplicates deposited in 27 herbaria (AAU, BOLV, BR, COL, E, F, GH, GUAY, HA, K, LOJA, LPB, MO, NY, P, PMA, PORT, SCZ, SEL, SRP, QCA, QCNE, UC, UNA, US, USM, and VEN). Field expeditions emphasized type localities of as many previously described species as possible. Loan material was obtained from 26 herbaria (A, AAU, BM, BR, C, CAS, COL, DAV, F, G, GH, GOET, K, LE, MA, MO, MT, MTJB, NY, P, PH, QCNE, S, SEL, U, WU). Additional visits were conducted to 19 herbaria (BOLV, BM, BR, CAS, E, GUAY, HA, K, LOJA, LPB, MO, NY, P, PORT, Q, QCA, QCNE, QPLS, VEN). Over 4,000 collections were studied, annotated, databased, and cited for this revision.

Other data represented in this study include 515 vouchered tissue samples, of which 213 were extracted and used for molecular systematic studies. Additionally, 4,500 photographic slides were taken for evaluating morphological diversity and developing a morphological cladistic dataset (see Clark et al. 2006). The taxon sampling from Clark et al. (2006) included 25 of the 27 species of *Glossoloma* (*G. bicolor* and *G. cucullatum* missing). Maps were generated using ArcView GIS 3.2a (ESRI 2000).

TAXONOMIC HISTORY

Glossoloma was described by Hanstein (1854) in the introduction of his monumental work *Die Gesneraceen des Königlichen Herbariums und der Gärten zu Berlin* [“Gesneriaceae of the royal herbarium and gardens in Berlin,” and a monographic overview of the family]. This work was spread out between eleven years and four separate parts (Hanstein 1854, 1856, 1859, 1865) published in the journal *Linnaea*. The overall goal of these key-stone publications was to provide a summary of the classification of the family with an emphasis on the Gesneriaceae at the herbarium (B) and the botanical garden in Berlin. Hanstein’s generic concepts changed considerably throughout the eleven years that spanned these five publications. For example, *Glossoloma* was initially recognized as a genus (Hanstein 1854), but later subsumed in a broader generic circumscription of *Alloplectus* (Hanstein 1865). Further broadening the circumscription of *Alloplectus* in 1865 included combining the following three genera that were recognized in 1854: *Heintzia* Karst., *Erythranthus* Oerst., and *Calanthus* Oerst. As a result, five genera that Hanstein

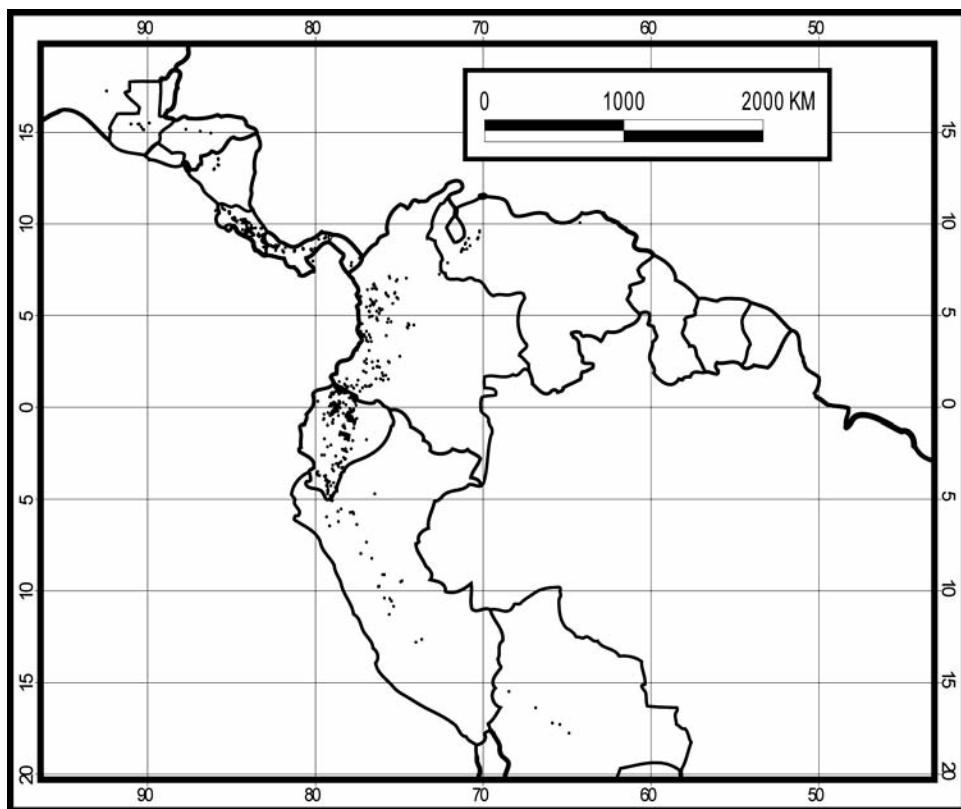

FIG. 1. Distribution of *Glossoloma* in Central and South America.

recognized in 1854 were included in *Alloplectus* in 1865. *Glossoloma*, with only one species (*G. tetragonum*), was reduced to a subgenus of *Alloplectus* (Hanstein 1865). Oersted (1858, 1861) was the only other systematist besides Hanstein (1854), who recognized *Glossoloma*.

Other than the type species (*G. tetragonum*) and the five species newly described in this revision, all species treated here as *Glossoloma* were previously assigned to *Alloplectus*. The generic concept of *Alloplectus* has a confusing history because over 140 names were attributed to this genus. The generic type species [*Alloplectus hispidus* (Kunth) Mart.] nests in a well-supported clade of five species distinct from the clade that includes the 27 species of *Glossoloma* (Clark et al. 2006). Other species of traditionally recognized “*Alloplectus*” nest in *Crantzia*, *Nematanthus*, *Columnea*, *Cobananthus* Wiehler, and *Drymonia*; the generic concepts recognized here are based on phylogenetic analyses that included in the taxon sampling the generic types of these genera (Clark et al. 2006). Initially, Hanstein (1854) recognized *Glossoloma* for one species (*G. tetragonum*) with tubular and broadly ampliate corollas (i.e., corollas lacking an apically constricted pouch) and *Alloplectus* for three species with apically constricted corollas (i.e., corollas with pouches often protruding or exceeding the mouth of the corolla). Hanstein (1854) recognized the following three species in his initial circumscription of *Alloplectus*: *Drymonia coccinea* (Aubl.) Wiehler, *Corytoplectus speciosus* (Poepp.) Wiehler, and *Nematanthus lanceolatus* (Poir.)

Chautems (see Clark, 2005, for the taxonomic history of *Alloplectus*). The only species included in Hanstein's initial circumscription of *Glossoloma* (Hanseini 1854) was *G. tetragonum*, the type species and basis of the clade that is recognized for the monograph presented here.

Oersted and Hanstein were developing classifications of Gesneriaceae during the same time period based on their extensive studies of herbarium and living material. Oersted traveled throughout Central America (1845–1848), and Hanstein had access to an extensive living collection at the botanical garden in Berlin. The two botanists cited each other frequently in their individual publications and in some cases cited each other's work from unpublished manuscripts. The citation of unpublished work has often caused confusion concerning the valid publication of names. For example, the name *G. tetragonum* has been incorrectly attributed to Oersted in the literature (Wiehler 1973; Skog 1999) and among determinations of herbarium specimens as “*Glossoloma tetragonum* Oersted.” This confusion stems from Hanstein's (1854) citing in synonymy Oersted's herbarium name “*Nematanthus tetragonus*” and reproducing a drawing from Oersted's unpublished manuscript. The correct name for this species is *Glossoloma tetragonum* Hanstein.

GENERIC DELIMITATION AND PHYLOGENY

The Neotropical Gesneriaceae comprise two subfamilies, all Gesneroideae and part of Coronantheroideae (Burtt & Wiehler 1995; Weber 2004). Coronantheroideae contain 9 genera and 20 species, which extend from Chile to the South Pacific Islands and Australia (Wiehler 1983; Weber 2004). The phylogenetic placement of the Coronantheroideae is not resolved, and the group has also been treated as the tribe Coronanthereae and included in the subfamily Gesneroideae (Skog & Boggan 2006). The Gesneroideae comprise eight tribes, 62 genera, and over 1000 species, and represent nearly half the worldwide diversity of the Gesneriaceae (Skog & Boggan 2006). Other estimates of Gesneroideae diversity range from 1500 species (Weber 2004) to 1800 species (Wiehler 1983; Burtt & Wiehler 1995). Episcieae is a member of Gesneroideae and is the most diverse tribe in the family with 22 genera and an estimated 784 species, or roughly 21% of all Gesneriaceae. *Glossoloma* is the sixth largest genus of Episcieae after *Columnea* (200+ spp.), *Drymonia* (100+ spp.), *Nautilocalyx* (60+ spp.), *Paradrymonia* (50+ spp.), and *Nematanthus* (30+ spp.).

The recognition of *Glossoloma* as distinct from *Alloplectus* and *Crantzia* promotes a more robust classification and a better understanding of Episcieae phylogeny by defining genera that represent monophyletic groups. Of the 22 genera in Episcieae, *Columnea* is the only genus that has been shown consistently to be monophyletic using morphological and molecular data (Smith 1994; Smith & Sytsma 1994a, b, c). The lack of monophyly for large genera (i.e., > 20 spp.) in Episcieae has been suggested for *Drymonia* (Smith 2000a; Clark & Zimmer 2003), *Episcia* Mart. (Smith et al. 1997), *Alloplectus* (Clark & Zimmer 2003), *Paradrymonia* (Smith & Carroll 1997; Smith 2000a; Clark & Zimmer 2003), *Codonanthe* (Mart.) Hanst. (Clark & Zimmer 2003), and *Nematanthus* (Clark & Zimmer 2003). *Nautilocalyx* includes 51 (Skog & Boggan 2006) to 80 species (Burtt & Wiehler 1995), and is one of the few large (i.e., > 20 spp.) episciod genera that has not been adequately tested for monophyly.

The traditional broadly drawn *Alloplectus* was a catchall group for taxa that are assigned here to *Glossoloma* (27 spp.), *Alloplectus* (5 spp.), *Crantzia* (4 spp.), *Nematanthus*

(1 sp.), *Columnea* (1 sp.), and *Drymonia* (5 spp.) (see Clark 2005; Clark et al. 2006). Most characters traditionally used to define *Alloplectus*, such as a fleshy bivalved dehiscent capsule, a pendent inflorescence of a reduced pair-flowered cyme, and a haploid chromosome number of $n=9$, are symplesiomorphic characters shared with other genera, such as *Drymonia* and *Paradrymonia*. Other characters previously used to define *Alloplectus*, such as a tubular and pouched corolla, are convergent with *Nematanthus*. Thus, *Alloplectus* had become a collection of species without unifying synapomorphies and could not be maintained after other genera with distinguishing features had been discerned.

Various phylogenetic hypotheses for the position of *Glossoloma* (as “*Alloplectus*”) have been proposed in the literature. Previous studies that included species treated here as *Glossoloma* (Smith & Sytsma 1994a, b, c; Smith 1996; Smith & Carroll 1997; Smith et al. 1997; Smith & Atkinson 1998; Smith et al. 1998; Smith 2000a, b, c; Zimmer et al. 2002; Clark & Zimmer 2003; Clark et al. 2006; Smith et al. 2004) are summarized in Fig. 2. With the exception of the work of Clark et al. (2006), most previous studies focused on resolving tribal and subfamilial relationships. Plastid markers, such as *ndhF*, *trnL-F*, and *trnE-T*, used in previous analyses were adequate for addressing tribal and subfamilial relationships, but owing to the lack of intraspecific variation in these markers, relationships among genera and species were poorly supported or are in conflict (e.g., Fig. 2A–D).

Recent molecular studies published for Gesneriaceae have focused on relationships at the level of genus and above. Most previous studies relied on genes that evolve at a relatively slow rate, such as the chloroplast gene *ndhF* (Smith & Carroll 1997; Smith et al. 1997) and the chloroplast *trnL-F* and *trnE-T* spacer regions (Zimmer et al. 2002). Clark and Zimmer (2003) produced a preliminary phylogeny of traditional “*Alloplectus*” based on ITS. The circumscription of *Glossoloma* presented here is based on phylogenetic hypotheses derived from molecular (ITS and *trnH-psbA*) and morphological data (99 characters), and was presented by Clark et al. (2006). This recent study included 25 of the 27 taxa of *Glossoloma*, excluding *G. bicolor* and *G. cucullatum*.

Glossoloma can be distinguished from other genera in Episcieae by several traits, which are summarized in Table 1. Most species (23 of 27) of *Glossoloma* are unbranched terrestrial subshrubs in contrast to the branched, primarily epiphytic habit found in *Drymonia*, *Columnea*, *Alloplectus*, and *Crantzia*. The presence of resupinate flowers, except in *G. anomalum*, is the most useful and obvious character for differentiating *Glossoloma* from other closely related genera. Two additional features that help differentiate *Glossoloma* are: 1) medially ampliate corollas with terminal pouches instead of the campanulate or medial pouches found in *Drymonia*; 2) corolla tube appearing laterally compressed (Fig. 37D; see also discussion of corolla morphology). Three of the four species of *Crantzia* have resupinate flowers, laterally compressed tubes, and medially ampliate corollas with terminal pouches. Thus, *Glossoloma* and *Crantzia* are morphologically similar, but differ by the obligate epiphytic habit in three of the four species of *Crantzia* and the primarily terrestrial habit in *Glossoloma*. The non-terrestrial species of *Glossoloma* are primarily Andean and facultative epiphytes, unlike the non-terrestrial species of *Crantzia*, which are primarily Caribbean and obligate epiphytes.

The species-level phylogeny presented here (Fig. 3) is based on phylogenetic analyses inferred from molecular (nrITS and cpDNA *trnH-psbA*) and morphological (99 characters) data presented in Clark et al. (2006). The primary objective of that paper was to address the monophyly of traditionally recognized genera and the placement of species previously recognized as *Alloplectus*. The goal was not to test hypotheses of species-level relationships within *Glossoloma*. The phylogeny of Episcieae shows a well-resolved and a strongly

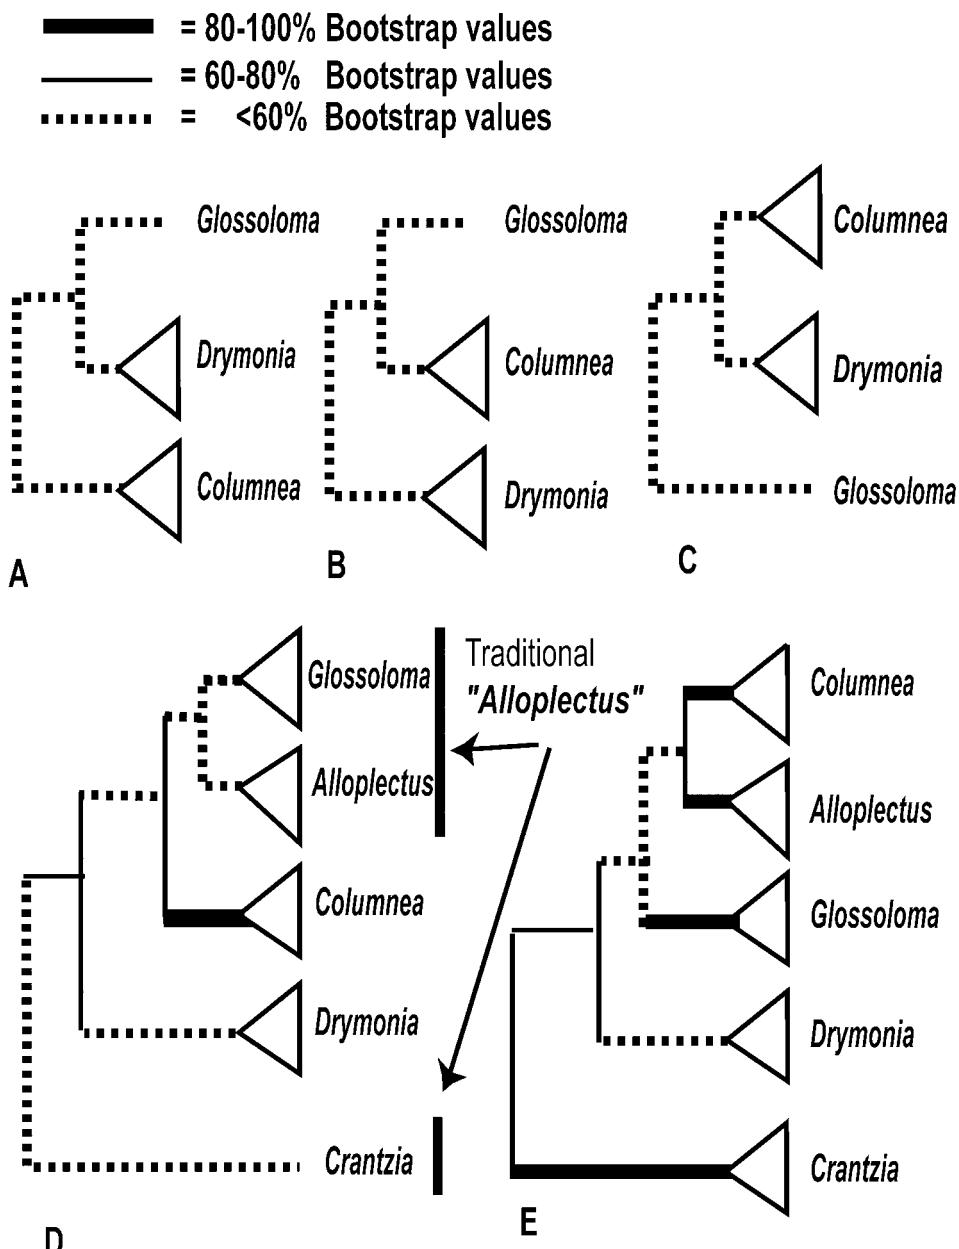

FIG. 2. Diagrammatic representation of phylogenetic hypotheses for the placement of *Glossoloma*. A. Based on molecular sequence data from *ndhF* (Smith & Carroll 1997; Smith et al. 1997) and combined analyses of the nr-ITS region (Smith 2000a). B. Based on cpDNA restriction site variation (Smith & Sytsma 1994a, b, c). C. Based on a combined analysis using cpDNA of the *trnL-F/trnE-T* regions and the ITS region (Zimmer et al. 2002). D. Based on the nrDNA ITS region (Clark & Zimmer 2003). E. Based on the ITS region, intergenic cpDNA spacer region *trnH-psbA*, and morphology (Clark et al. 2006). Other species traditionally recognized as *Alloplectus* are transferred into *Crantzia* (4 spp.), *Nematanthus* (1 sp.), and *Drymonia* (4 spp.). Triangles representing terminal taxa indicate a sample size of two or more species. Reprinted with permission from *Selbyana* (Clark 2005: Fig. 1).

TABLE 1. Comparison of *Alloplectus*, *Glossoloma*, *Columnea*, *Drymonia*, and *Crantzia*.

	<i>Glossoloma</i>	<i>Alloplectus</i>	<i>Columnea</i>	<i>Drymonia</i>	<i>Crantzia</i>
Leaves	Isophyllous	Isophyllous	Anisophyllous (rarely isophyllous)	Isophyllous	Isophyllous
Flower orientation	Resupinate (1 exception)	Not resupinate	Not resupinate	Not resupinate	Resupinate or not resupinate
Habit	Terrestrial (rarely epiphytic)	Obligate epiphyte	Facultative epiphyte or terrestrial	Epiphytic or terrestrial	Epiphytic or terrestrial
Fruit	Fleshy capsule	Fleshy capsule	Berry (rarely fleshy capsule)	Fleshy capsule or berry	Fleshy capsule

Corolla pouch	Terminal when present	Terminal when present	Medial when present	Medial when present	Terminal when present

supported *Glossoloma* (BS=88%), but support at the species-level is weak with only three branches with bootstrap values greater than 50% (Fig. 3). Although well resolved, support for internal groups is not robust. Thus, infrageneric relationships are not yet proposed, and the species in this monograph are listed in alphabetical sequence.

MORPHOLOGY

Habit. Most species of *Glossoloma* are terrestrial woody subshrubs with an unbranched primary stem. A few species are succulent terrestrial herbs or facultative epiphytes. Only two species (*G. penduliflorum* and *G. scandens*) are obligate epiphytes with scendent stems. Most species attain heights of 1 to 1.5 meters. The tallest species seen in the field is *G. schultzei* in eastern Ecuador, which can attain a height of three meters. The species that is most variable in height is *G. ichthyoderma*, which can reach maturity at 40 cm, but can also attain a height of two meters. Most of the terrestrial subshrub species have fibrous roots and erect unbranched stems. Occasionally the stems are decumbent, as observed in many individuals of *G. chrysanthum* from a population in Venezuela, where some individuals had stems to 4 meter long with numerous erect shoots and terminally clustered leaves (Fig. 13C). Some species are described as having erect, horizontal, elongate stems, or dorsiventral stems. Elongate stems are associated with species that are obligate epiphytes. The term horizontal is associated with species growing on vertical rock faces or steep roadside embankments, where stems grow parallel to the ground instead of erect. Many of these species are facultative epiphytes and can therefore be terrestrial when young and epiphytic when older. The term dorsiventral is used to describe a two-dimensional fern-frond shaped shoot. Dorsiventral shoots are characteristic of the section *Collandra* in the genus *Columnea*. In *Glossoloma* dorsiventral shoots are found only in *G. pycnosuzygium*.

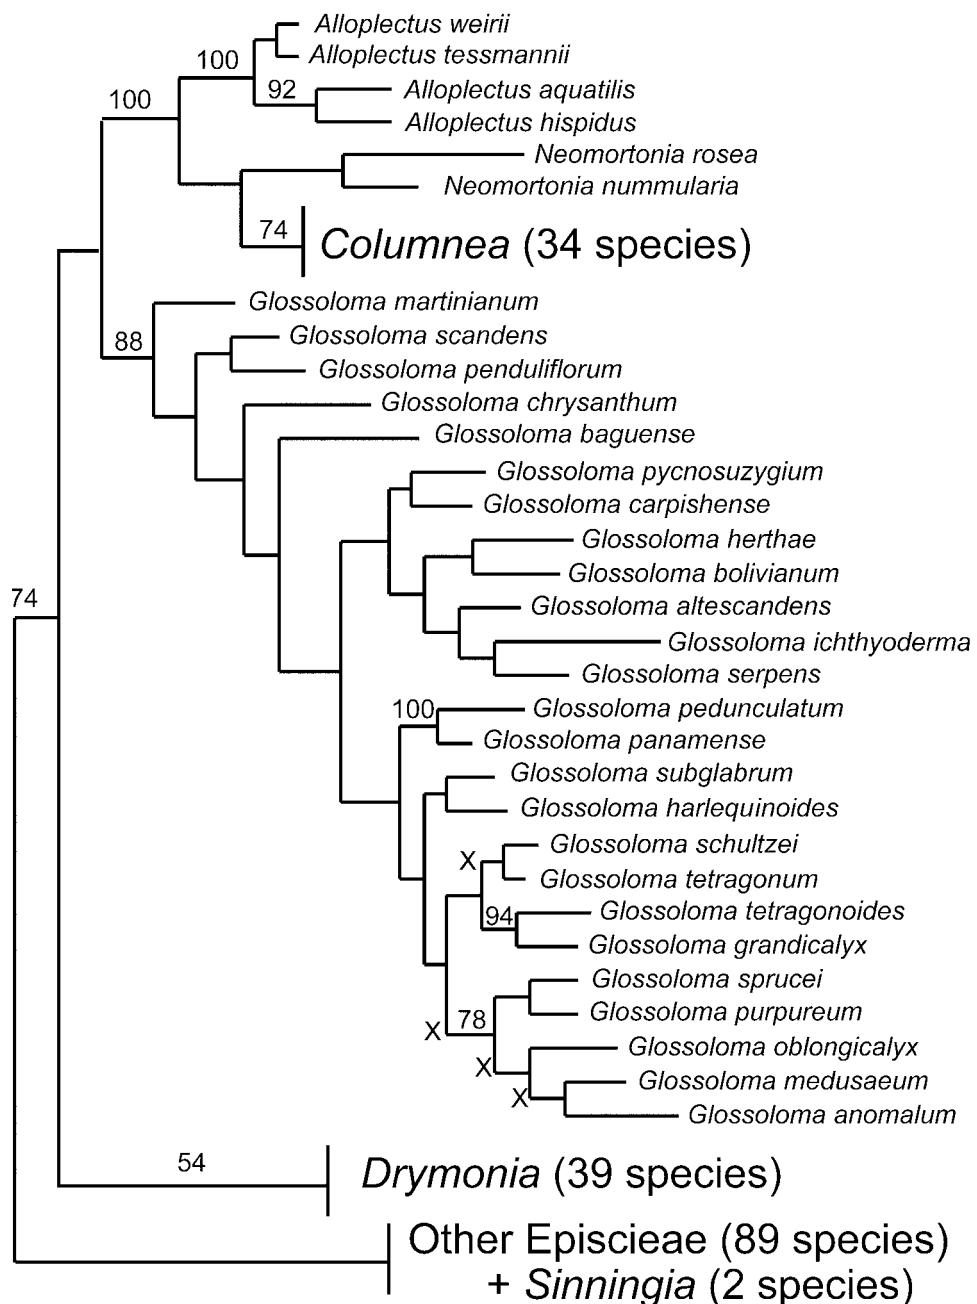

FIG. 3. Phylogeny of *Glossoloma* presented in Clark et al. (2006). Inferred from two molecular markers [the internal transcribed spacer region of 18S-26S nrDNA (ITS) and the cpDNA *trnH-psbA* intergenic spacer for 155 species] and morphological data (99 characters for 120 species) combined in a total evidence analysis. One of the 4,360 most parsimonious cladograms is shown; nodes that collapse in the strict consensus tree are indicated ("X") at the base of the branch. Bootstrap values (>50%) for nodes present in the strict consensus tree are given at the base of the branch.

Indumentum. Gesneriaceae are often recognized by their “hairy” appearance, especially the leaves. The trichomes in *Glossoloma* are nearly always abundant on immature or young parts, whether they are leaves, shoots, or flowers. This feature is especially evident on the mature regions of stems, which are nearly always glabrescent proximally and densely pilose to villous distally. Minute trichomes forming a puberulent indumentum are also common on corollas and calyces. Gland-tipped trichomes are common near the apex of the inner surface of the corolla tube. Leaf blades are nearly always pubescent on the abaxial surface and nearly glabrous on the adaxial surface. Most often, leaves have a tendency to be more pubescent on major veins, but occasionally the entire surface is uniformly pubescent. Nearly all species of *Glossoloma* are pubescent, with the exception of *G. subglabrum* and *G. baguense*. Occasionally, *G. subglabrum* has a sparsely puberulent indumentum on the leaves. The most densely pubescent species is *G. sprucei*, which has slender multicelled trichomes up to 7 mm long on the stems and calyces.

Leaves. The leaf arrangement in most species of *Glossoloma* is opposite and decussate. The leaves of terrestrial species are isophyllous, but epiphytic species have leaves unequal in a pair, but not markedly anisophyllous, as in *Columnea*. The leaves of species with erect and unbranched shoots are nearly always terminally clustered. The leaves in scandent or facultative epiphytes are evenly distributed on elongate stems. The blades may be ovate, elliptic, obovate, or oblanceolate. Most species have oblong to elliptic leaves. The texture of the leaves ranges from subcoriaceous to membranaceous. Adaxial leaf surfaces are usually dull green, and abaxial surfaces range from light green to red, but leaf color is variable and inconsistent within most species and even individuals. For example, the abaxial leaf surfaces of *G. herthae* will vary from light green to red within individuals. The only species with distinctive leaf coloration is *G. purpureum*, which has dark purple abaxial leaf surfaces. The blades have 3 to 14 secondary veins per side, but this feature is variable within a species. Two species with distinctive venation are *G. altescandens*, which has the fewest number of secondary veins (3–5/side) and *G. subglabrum*, which has the most number of secondary veins (9–14/side). The length of the blade ranges from 2 cm (*G. altescandens*) to 37 cm (*G. panamense*). Most leaf blades are not curved, with the exception of falcate leaves in *G. martinianum*, *G. herthae*, and *G. altescandens*. The upper leaf surface is flat (i.e., not bullate or rugose) and glabrous to glabrescent. Petioles are always present and slightly sulcate to terete. The longest petioles are found in *G. panamense* (to 15 cm long) and the shortest in *G. altescandens* (<1 cm).

Inflorescence. The basic unit of the inflorescence in the Gesneriaceae is a pair-flowered cyme (Weber 1973, 1978, 1982; Wiegler 1983; Kvist & Skog 1992a, 1996). In *Glossoloma* and most other members of the Episcieae, the inflorescence unit is reduced to a single axillary flower. In some species, such as *G. ichthyoderma* (Fig. 20A), fascicles or synflorescences of 10 to 15 flowers are clustered in a leaf axil, but it is difficult to differentiate the number of flowers per individual synflorescence. All inflorescence units in this treatment are therefore referred to as appearing fasciculate with notes pertaining to the number of individual flowers per leaf axil. Most often, flowers occur as solitary units in the leaf axil, such as *G. penduliflorum* (Fig. 28A), but occasionally some species have up to eight individual flowers at a node, such as *G. schultzei* (Fig. 33A). One exception is *G. pendulatum* in which the inflorescence axis is indeterminate and reaches up to 2 cm in length (Fig. 26E). This inflorescence is not homologous to the determinate inflorescence common in members of the tribe Gloxinieae and Sinnienieae. The indeterminate elongate

inflorescence unit of *G. pedunculatum* is a feature that has not been reported before now, but has been observed in other genera (e.g., *Drymonia ecuadorensis* Wiehler). All species of *Glossoloma* have bracteoles subtending elongate pedicels (Fig. 33A). The persistence of the bracteoles (e.g., early vs. late caducous) is noted in the descriptions.

Pedicel. Pedicel length in *Glossoloma* ranges from 0.5 cm (*G. pycnosuzygium*) to 15 cm (*G. penduliflorum*). In species with erect stems, immature flowers are subtended by erect pedicels that then drop below the petioles at anthesis. In species with horizontal stems (i.e., obligate and most facultative epiphytes) the pedicels are stiff, horizontal, and support the flowers so that they are oriented parallel to the ground. Nearly all species of *Glossoloma* have resupinate flowers, but the pedicels themselves are not twisted. Serial cross sectioning of pedicels from the stem to the base of the calyx revealed no obvious twist in the pedicels. Additional tissue clearings and saffronin staining of pedicels were carried out to look for evidence of twisting, but none was observed (Clark, unpubl.). At present, the mechanism of resupination is unknown.

Distinctive features on many pedicels near the base of the calyx are the oval to round, dark purple structures, referred to as pedicel enations, as seen in *G. bolivianum* (Fig. 10B). These are sometimes obscured by bracts or trichomes, and appear in 18 of the 27 species of *Glossoloma*. Similar enations have been reported in *Columnea* sect. *Pentadenia* (Smith 1994; Smith & Sytsma 1994c); Smith referred to these as glands, but because it is not apparent that they secrete any substance, they are here called enations. Smith noted that the “glands” grow more distinctive in *Columnea strigosa* Benth. during fruit development. In *Glossoloma* the enations appear to develop or grow after anthesis and become more conspicuous in fruit. Pedicel enations are homoplastic and are common throughout the tribe Episcieae (Clark et al. 2006).

Calyx. The calyx lobes are basally connate and appear nearly free. The lobes are either valvate (Fig. 28C), imbricate (Fig. 30C), or folded in a conduplicate manner (Fig. 33B). Conduplicate folding is a term used when each lobe is appressed to an adjacent lobe and folded lengthwise with the margin curved inward, as seen in *G. schultzei* (Fig. 33B). Conduplicate folding is present in 18 of the 27 species of *Glossoloma*, and is most distinctive in *G. cucullatum* (e.g., cucullate = “hooded”), where the lobes are stiff and difficult to flatten without tearing (Fig. 14B). The folding sometimes accentuates the base of the calyx lobe to appear cordate or sagittate. In species where no folding is present, the base of the lobes appears truncate, as seen in *G. pycnosuzygium* (Fig. 30C, D).

Four of the five calyx lobes are equal in size and shape. The median sepal is smaller and narrower to accommodate the nectary gland and basal gibbosity of the corolla. Because the flowers are resupinate (except in *G. anomalum*), the median calyx lobe of *Glossoloma* is on the ventral or lower surface and is homologous to the upper surface or dorsal lobe of most other members of the Gesneriaceae. This study uses the terms upper/dorsal and lower/ventral to describe the specific features as they appear oriented on a flower, whether it is resupinate or not. Thus, the median calyx lobe on a non-resupinate flower would be on the ventral or lower surface, and the median calyx lobe on a resupinate flower would be on the dorsal or upper surface.

The margins of the calyx lobes may be entire, serrate, dentate, or fimbriate. The margins are said to be fimbriate when the individual serrations appear like a fringe of thread-like enations, as seen in *G. anomalum* (Fig. 8B, E) and *G. purpureum* (Fig. 29B, C). Fimbriae are most pronounced in *G. sprucei*; one individual serration can reach 1.5 cm in

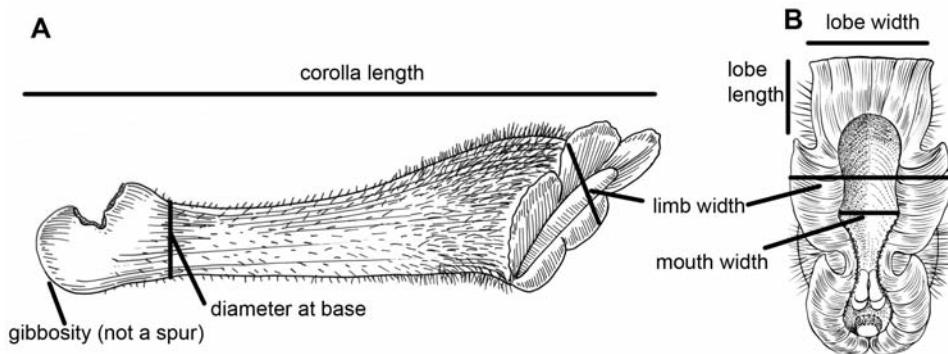

FIG. 4. Diagram of the corolla of *Glossoloma*, showing flower measurements used in this study. A. Lateral view of corolla showing basal gibbosity (not a spur); medially ampliate and oblique corolla. B. Front view of corolla showing lobe, limb, and mouth dimensions, and the appearance of being laterally compressed.

length with additional unequal serrations, which make it difficult to differentiate trichomes from serrations. The individual enations may bear trichomes, as in *G. anomalum* (Fig. 8D) or not, as in *G. purpureum* (Fig. 29B).

Corolla. The corolla is tubular, bilaterally symmetrical, and gibbous on the lower surface with five apical lobes. Most species of *Glossoloma* appear laterally compressed at the apex of the corolla tube, resulting in the width being half the length as the height, as seen in *G. subglabrum* (Fig. 37D). In this study the term “mouth” describes the apex of the corolla tube without lobes, and the term “limb” describes the apex of the corolla tube with lobes (Fig. 4). A laterally compressed corolla is also a commonly found in most species of *Nematanthus*. The appearance of laterally compressed corollas is difficult to detect from herbarium specimens, which is why some descriptions and illustrations of species of *Glossoloma* do not mention this feature (e.g., Fig. 29 of *G. purpureum* in Kvist & Skog 1992b). The corolla mouth of these species is oblique or slanted when viewing the flower laterally (Fig. 4A). Species of *Glossoloma* that have non-laterally compressed (i.e., uniformly round) throats are *G. anomalum*, *G. bicolor*, *G. ichthyoderma*, and *G. martinianum*. The mouth of these species is horizontal and not oblique or slanted. There is a correlation between laterally compressed corolla tubes with zygomorphic corolla lobe arrangement (Fig. 4), and non-laterally compressed with subregular corolla lobe arrangement. The laterally compressed corollas have four nearly equal lobes, a well-developed dorsal lobe, and a non-constricted throat. In contrast, the non-laterally compressed corollas have nearly equal lobes and an apically constricted throat. Nearly all members of *Glossoloma* have a pouched region near the apex of the corolla. The pouched region is described as becoming ampliate (e.g., nearly tubular) or ventricose on the upper surface (e.g., swollen or inflated). Corollas of only four species of *Glossoloma* are described with corolla tubes ampliate or nearly tubular (*G. harlequinoides*, *G. panamense*, *G. pedunculatum*, and *G. subglabrum*). Most species of *Glossoloma* are described as having a ventricose corolla tube. This feature is often not shown in illustrations that were based on herbarium collections, as in *G. baguense* (Fig. 9D) where the tube is illustrated without a ventricose pouch. Field observations based on five collections of *G. baguense* have confirmed that this species has a significant ventricose pouch (e.g., Clark et al. 5700). Another notable feature for some

species of *Glossoloma* is the presence of a constricted throat; this character is pronounced in four species and evident in field and herbarium collections, as shown for *G. ichthyoderma* (Fig. 20D). Seven species are described as having slightly constricted throats; the constriction is obvious in the field, but subtle on some pressed specimens, as in *G. serpens* (Fig. 34D). Most species of *Glossoloma* do not have an apically constricted throat. Common corolla measurements and terms used in this study are shown in Fig. 4.

The corolla tube orientation relative to the calyx ranges from oblique (e.g., *G. tetragonum*) to perpendicular (e.g., *G. bolivianum*). Twelve species have an oblique corolla tube orientation relative to the calyx, and this character occurs in facultative or obligate epiphytes. Fifteen species have a perpendicular corolla tube orientation relative to the calyx, a feature found only in species with a terrestrial subshrub habit. Posture refers to how the flower is held at anthesis. Pendent flowers are more common in *Glossoloma*, and the term is used to describe flowers that are held below the petioles and usually borne on elongate pedicels. A horizontal flower posture is defined as flowers that are borne on relatively short pedicels and are held parallel to or sometimes above the petiole (e.g., *G. alter scandens*, *G. baguense*, *G. martinianum*, and *G. medusaeum*).

Corolla color on the outer surface is usually uniformly red or uniformly yellow, but this may vary within or among populations. Some species (e.g., *G. grandicalyx*, *G. tetragonoides*) have a uniformly colored tube with contrasting lobes (e.g., yellow tube with red lobes). The only non-uniformly colored corolla tube is found in *G. harlequinoides*, which has an alternating red and white pattern. The inside of the corolla may be the same color as the outer surface or it may be spotted.

Nearly all corolla tubes of *Glossoloma* have trichomes throughout the inner and outer surfaces, with the exception of *G. baguense*, which is glabrous on the outside. Trichomes vary from unbranched to branched, and often more than one type is present. Most species have gland-tipped trichomes clustered on the ventral region of the inner surface of the corolla tube. Steiner (1985) suggested that the glandular trichomes inside the corolla tube of *Drymonia serrulata* (Jacq.) Mart. promote the adhesion of pollen grains to the body of pollinators (e.g., *Epicharis* bees) by secreting oil that is deposited on the anthers. This phenomenon has not been studied in *Glossoloma*, but an abundance of glandular trichomes is found near mature anthers on the ventral inner surface of the corolla.

Androecium and nectary. *Glossoloma*, like most other New World members of Gesneriaceae, has four stamens with coherent, protandrous anthers. A staminode is often present and easy to detect in the field, but difficult to see without a microscope on herbarium specimens. Anthers are held in the lower portion of the apical region of the flower during anthesis and are not exserted beyond the corolla throat. Filaments coil and pull the anthers back toward the base of the flower during later stages of flower maturity.

Filaments are connate at the base and adnate to the corolla. The connate region of the filaments form a curtain-like structure that is open at the region of the staminode (e.g., usually the dorsal side). This connate region or open sheath is referred to as a filament curtain and although poorly documented in Gesneriaceae has been studied in Acanthaceae (Manktelow 2000). A filament curtain is present on all species of *Glossoloma* and varies in length from 1 to 4 mm. The filaments are usually glabrous, although in one species (*G. penduliflorum*) glandular trichomes are present.

Pollen grains were studied in five species and very little variation was observed. Grains are typically tricolporoidate to tricolporate with minute perforations on the tectum (Fig. 5). The lumina are usually evenly spaced, but sometimes they are larger in the

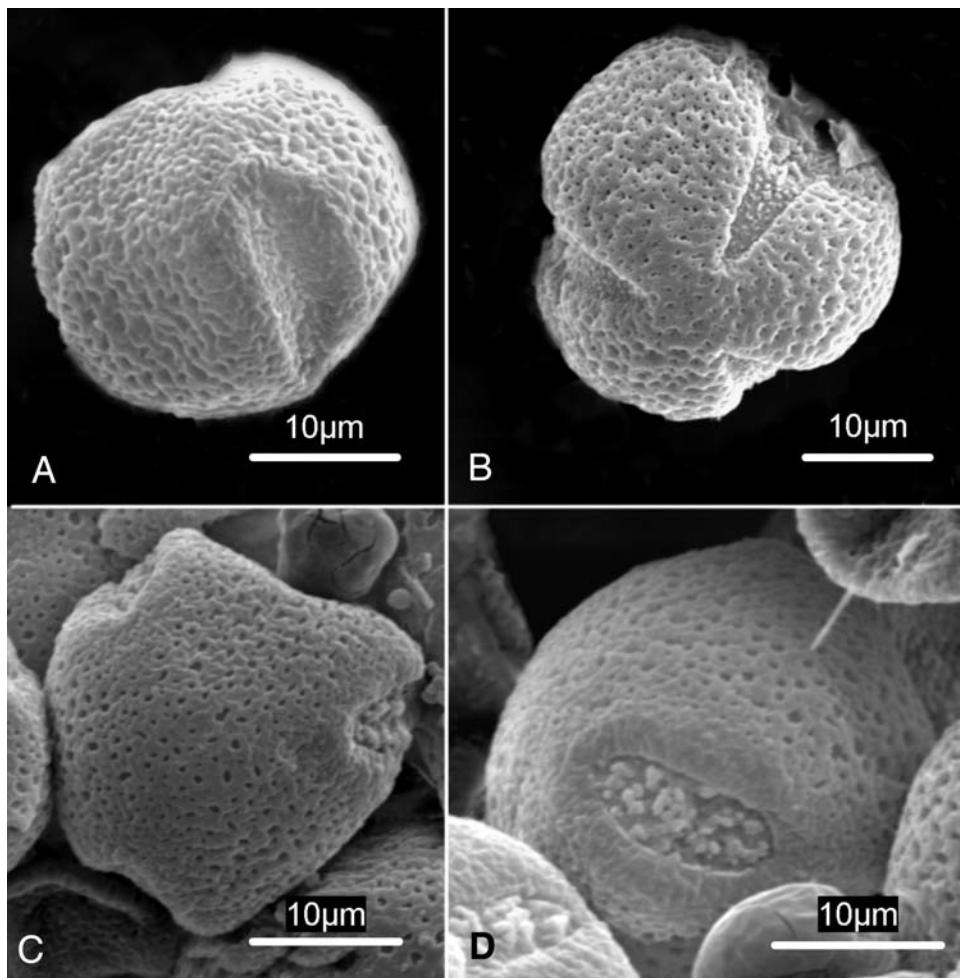

FIG. 5. SEM images of pollen grains of *Glossoloma* and *Drymonia*. A. *G. tetragonoides* (J. L. Clark 4454). B. *Drymonia collegarum* J. L. Clark & J. R. Clark (J. L. Clark 4592), note: this taxon nests in a clade of traditionally recognized “*Alloplectus*” species recently transferred to *Drymonia* (Clark 2005; Clark et al. 2006). C, D. *Glossoloma baguense* (J. L. Clark 5448).

mesocolpus. The colpi are prominent and almost span the entire polar length region. Occasionally, the colpi are shorter and less prominent, and span only 1/3–2/3 of the polar length region. Pollen grain morphology differed little between *Glossoloma* and *Drymonia*, and therefore was not explored further beyond the five species initially surveyed.

Nectaries are usually bilobed and located on the ventral surface of the flower. Some nectaries are emarginate to truncate (e.g., *G. panamense*, Fig. 25B), but this feature is difficult to evaluate on pressed specimens where the nectary is easily disfigured. Nectaries are glabrous, white, and occur within the gibbosity at the base of the corolla tube.

Gynoecium. The gynoecium is relatively uniform throughout *Glossoloma*. The ovary is densely to sparingly pilose. The style is glabrous, except in *G. pycnosuzygium*, which

has styles that are sparingly pilose. Stigmas are usually stomatomorphic, but occasionally they are weakly bilobed (e.g., *G. panamense*). The stigma and stamens do not extend beyond the throat of the corolla.

Fruit and seeds. In 22 of the 27 species in which fruits were observed, the fruit is a fleshy bivalved laterally compressed capsule that splits loculicidally. Most fruit valves are convex and fully reflexed at maturity to 180° (Fig. 25C). A second type of fruit dehiscence is described below, where fruit valves are convex but are mature when the valves reach 45° (Fig. 18C). The two reflexed carpel valves separate from the placentae and usually contrast in color from the fleshy mass of funiculi and seeds. Wiegler (1983) suggested that these “display” fruits are visual targets for seed dispersal agents, such as birds, fruit-eating bats, and possibly monkeys (Wiegler 1983). Five species of *Glossoloma* (*G. anomalum*, *G. herthae*, *G. ichthyoderma*, *G. martinianum*, and *G. medusaeum*) lack the contrasting colored valves and appear to open only slightly to 45° at maturity. These fruits are usually white, non-reflexed, and non-fleshy. The calyx is persistent in fruit and usually becomes fully reflexed when the fruit valves mature. Thus, the inside of the calyx and the reflexed valve walls of the fruit are similar in color and may add to the visual impact of the fruit.

Seeds were studied for 22 of the 27 species of *Glossoloma*. Each fruit contains numerous seeds (ca. 100–150), which are mostly ellipsoid to fusiform. The seeds range from 0.5 to 1.1 mm long and 0.2 to 0.5 mm wide. The surfaces are longitudinally striate owing to cells that are oriented spirally. Beaufort-Murphy (1983) evaluated and depicted SEM-photos of seeds of *G. cucullatum* and *G. ichthyoderma*, but few of the 50+ characters evaluated by Beaufort-Murphy differed among these two species and closely related genera (e.g., *Drymonia* and *Columnea*).

TAXONOMY

Glossoloma Hanstein, Linnaea 26: 191, 208, 209. 1854.—TYPE: *Glossoloma tetragonum* Hanstein.

Shrubs or suffrutescent herbs, terrestrial or epiphytic; roots fibrous, stems terete to quadrangular, erect, horizontal, or sometimes scandent. Leaves opposite, nearly equal in a pair, petiolate, elliptic to ovate or oblanceolate, entire to serrate. Flowers usually resupinate, axillary, solitary or in fascicles of 2 to 5, bracteate, peduncles rarely evident. Calyx usually colored or green, the 5 lobes nearly free, subequal, often broad, entire to strongly serrate to fimbriate, pubescent to pilose. Corolla tubular and usually ampliate, rarely hypocrateroid, yellow or red, oblique to horizontal in the calyx, constricted or not in the throat, commonly appearing laterally compressed, gibbous at the base, often ventricose below the mouth, the 5 lobes of the limb usually small. Stamens 4, not exserted, the filaments adnate to the base of the corolla tube, and forming an open sheath, the anthers transversely oblong, coherent or becoming free, dehiscing by longitudinal slits; staminode present or absent; disc a bilobed gland, rarely single-lobed. Ovary superior, pilose, the style included. Fruit a fleshy bivalved capsule surrounded by the persistent calyx; seeds numerous, surface longitudinally striate owing to spirally oriented cells.

KEY TO THE SPECIES OF GLOSSOLOMA

NOTE: Species for which the nature of the habit is sometimes misinterpreted are keyed under both leads of couplet 2.

1. Flowers not resupinate, nectary gland on dorsal surface; calyx lobes fimbriate; corollas 1.5 to 2.5 cm long. *2. G. anomalum*
1. Flowers resupinate, nectary gland on ventral surface; calyx lobes not fimbriate or fimbriate; corollas 2.5 to 6.0 cm long.
 2. Epiphytic subshrubs or herbs.
 3. Flowers solitary.
 4. Flowers pendent and subtended by an elongate slender pedicel 8–15 cm long. *18. G. penduliflorum*
 4. Flowers horizontal and subtended by a stout pedicel. *1. G. altescandens*
 3. Flowers in fascicles.
 5. Stems not scandent, elongated to 2 m.
 6. Calyx lobes broadly elliptic; leaf blades lanceolate to oblong; abaxial leaf surface densely tomentose. *13. G. martinianum*
 6. Calyx lobes broadly ovate or rotund; leaf blades ovate to elliptic; abaxial leaf surface glabrous or pilose.
 7. Leaf blades with 3–5 lateral veins per side, 2–5 cm long. *1. G. altescandens*
 7. Leaf blades with 6–8 lateral veins per side, 4–15 cm long.
 8. Calyx lobes 4–15 mm long.
 9. Calyx lobe arrangement imbricate; lobes rotund, 5–15 mm long.
 9. Calyx lobe arrangement valvate; lobes broadly ovate to oblong, 4–8 mm long. *20. G. pycnosuzygium*
 8. Calyx lobes 20–25 mm long. *23. G. serpens*
 5. Stems scandent, elongated to more than 2 m.
 10. Calyx lobes linear; calyx with five equal lobes; Ecuador and Colombia. *21. G. scandens*
 10. Calyx lobes broadly ovate; calyx with four equal lobes, the median (ventral) lobe smaller and narrower; Venezuela. *7. G. chrysanthum*
 2. Terrestrial subshrubs or herbs.
 11. Stems horizontal, occasionally pendent to dorsiventral on steep slopes; orientation of corolla perpendicular relative to the calyx or slightly oblique.
 12. Calyx lobes valvate to separate.
 13. Leaf blades lanceolate, abaxially densely tomentose. *13. G. martinianum*
 13. Leaf blades ovate, abaxially pilose to puberulent. *1. G. altescandens*
 12. Calyx lobes imbricate or conduplicate (i.e., when each lobe is appressed to an adjacent lobe and folded lengthwise with the margin curved inward).
 14. Calyx lobes conduplicate.
 15. Calyx lobes 20–25 mm long, sagittate at base; nectary a single gland. *23. G. serpens*
 15. Calyx lobes 10–17 mm long, truncate at base; nectary two valvate glands.
 16. Spotting in corolla throat present; calyx lobe to 12 mm wide. *6. G. carpishense*
 16. Spotting in corolla throat absent; calyx lobe to 5 mm wide. *7. G. chrysanthum*
 14. Calyx lobes imbricate.
 17. Corolla densely pilose; Bolivia. *5. G. boliviianum*
 17. Corolla glabrescent to sparingly pilose; Costa Rica, Panama, Colombia, Ecuador, Peru, Venezuela.
 18. Leaf blades elliptic and slightly falcate; calyx margins entire to serrulate; Colombia, Ecuador, Peru. *11. G. herthae*
 18. Leaf blades obliquely elliptic to obovate or oblanceolate, not falcate; calyx margins serrate; Costa Rica, Panama, and Venezuela. *20. G. pycnosuzygium*
 11. Stems erect; orientation of corolla oblique relative to the calyx.
 19. Inflorescence with a well-developed peduncle (over 1 cm long). *17. G. pedunculatum*
 19. Inflorescence epedunculate, flowers appearing fasciculate.
 20. Calyx lobe margins fimbriate.
 21. Abaxial leaf surface dark purple. *19. G. purpureum*
 21. Abaxial leaf surface green, occasionally greenish red.

- 22. Stems densely wooly distally. *G. sprucei*
- 22. Stems densely strigillose distally.
- 20. Calyx lobe margins serrate, serrulate, dentate, laciniate, or entire.
 - 23. Corolla tube ampliate (e.g., widening at apex and nearly uniformly tubular).
 - 24. Corolla tube not uniformly colored, red with white splotches; calyx lobes revolute. *G. harlequinoides*
 - 24. Corolla uniformly colored, salmon to orange or red; calyx lobes valvate to separate.
 - 25. Leaf blades pubescent; apical region of stem pubescent; leaf blades with 6–8 lateral veins per side. *G. panamense*
 - 25. Leaf blades glabrescent; apical region of stem glabrous to glabrescent; leaf blades with 9–14 lateral veins per side. *G. subglabrum*
 - 23. Corolla tube ventricose (e.g., apex swollen or inflated on upper surface).
 - 26. Stems with an exfoliating scale-like epidermis. *G. ichthyoderma*
 - 26. Stems lacking an exfoliating scale-like epidermis.
 - 27. Calyx lobe margins serrate or laciniate.
 - 28. Calyx lobes cucullate, the apex recurved. *G. cucullatum*
 - 28. Calyx lobes flat, the apex not recurved.
 - 29. Calyx lobes to 30 mm long, margins serrate to dentate. *G. tetragonum*
 - 29. Calyx lobes to 25 mm long, margin shallowly serrate. *G. tetragonoides*
 - 27. Calyx lobe margins entire or serrulate.
 - 30. Stems densely villous. *G. schultzei*
 - 30. Stems glabrescent to sparingly pilose.
 - 31. Corolla not uniformly colored (combination of red and yellow).
 - 32. Corolla tube bright yellow with dark red lobes. *G. grandicalyx*
 - 32. Corolla tube red with yellow patch on dorsal surface. *G. bicolor*
 - 31. Corolla uniformly red or uniformly yellow.
 - 33. Calyx lobe arrangement conduplicate. *G. oblongicalyx*
 - 33. Calyx lobe arrangement imbricate.
 - 34. Pedicels equal to or longer than petioles; outer surface of corolla glabrous. *G. baguense*
 - 34. Pedicels shorter than petioles; outer surface of corolla densely pilose. *G. bolivianum*

1. *Glossoloma altescandens* (Mansfeld) J. L. Clark, Selbyana 25: 197. 2005. *Alloplectus altescandens* Mansfeld, Repert. Spec. Nov. Regni Veg. 41: 148. 1936.—TYPE: PERU. Loreto: upper Río Marañón, delta of Río Santiago, tide-free non-flooded forest, 1 Oct 1924, G. Tessmann 4182 (B, destroyed).—ECUADOR. Morona-Santiago: Cordillera Morire, San Miguel de los Cuyes, 2400–3400 m, 7 Jan 2001, J. L. Clark & C. Morocho 5847 (neotype, designated by Clark, 2005: US!; isoneotypes: HA! K! MO! NY! QCNE! SEL!).

Subshrubs, terrestrial or epiphytic; stems erect, rarely branched, to 1.5 m tall, 4–6 mm in diameter, subwoody, internodes 2–6 cm long, subquadrangular, glabrescent proximally, pilose distally, leaf scars slightly raised from the stem surface. Leaves opposite, equal or subequal in a pair; petioles to 1 cm long, pilose; blades 2–5 cm long, 2–3.5 cm wide, ovate to elliptic, base acute, apex shortly acute, margin serrate, adaxially dark green, uniformly pilose, abaxially pale green, pilose to puberulent, more densely pilose on venation, subcoriaceous when dry, lateral veins 3–5 per side. Flowers solitary, resupinate, posture horizontal at anthesis, bracteoles not seen; pedicels 1–4.5 cm, longer than the petiole, elongating in fruit, sparingly pilose, pedicel enations absent. Calyx lobes nearly free, each appressed to adjacent lobe, folded lengthwise with the margin curved inward at base only,

otherwise spreading and separate, erect, nearly equal, to 15 mm long, to 8 mm wide, broadly ovate, base truncate, apex acute, margin serrate, red, abaxially pilose, adaxially pilose. Corolla to 3.4 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla perpendicular relative to calyx; base ca. 6 mm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat not constricted, appearing laterally compressed, ca. 10 mm wide (at mouth), outside uniformly pilose, inside mostly glabrous, with glandular trichomes at throat, red spotting sometimes present on the upper surface of throat; limb reflexed, zygomorphic, to 10 mm wide, yellow, orange, or red, with lobes nearly equal, 7–8 mm long, 7–8 mm wide, rotund, entire. Nectary gland bilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 1.4 cm long, adnate to base of corolla tube for 5–7 mm, connate for 2–4 mm, forming an open sheath, glabrous; anthers 1.5 mm long, 2 mm wide, dehiscing by longitudinal slits; staminode present. Ovary ca. 7 mm long, ca. 6 mm in diameter, ovoid, densely pilose, style 1.8 cm long, glabrous, stigma stomatomorphic. Fruit not seen. Frontispiece; Fig. 6.

Phenology. Collected in flower during January, February, April, May, July, August, October, and December; fruits not seen.

Distribution (Fig. 7). Ecuador (Loja, Morona-Santiago, Zamora-Chinchipe) and Peru (Loreto); eastern Andean slopes in wet montane forests; 2300–3400 m.

ADDITIONAL SPECIMENS EXAMINED. **Ecuador.** LOJA: road Loja–Saraguro, 5 km N of San Lucas, *Bohlin & Bohlin* 1032 (US); Loma del Oro, S of Saraguro, *Camp* 693 (NY-2 sheets, S, US); pass on road to Zamora, *Dodson & Thien* 684 (US); road to Cerro Toledo, 13–14 km E of main road below Yangana, *Dorr* 6565 (NY, QCA); road to Fierro Acru, N of Pichig, *Dorr* 6653 (NY, QCA, QCNE, US); Horta–Naque, SE of Loja, *Espinosa* 967 (LOJA, US); 14 km W of Loja, *Espinosa & Espinosa* 2286 (LOJA, US); Loma de Loro, 6 km S of Saraguro on road to Loja, *Harling & Andersson* 21900 (US); road Loja–Saraguro, la Loma del Oro, *Jaramillo & Winnerskjold* 5867 (GB, QCA, MO), *Jaramillo & Winnerskjold* 5883 (AAU, QCA); road Saraguro–Loja, Km 12.4, turnoff towards Fierro Urco, Km 3.8–7.1, *Jørgensen et al.* 1321 (MO, QCNE); Páramos de Saraguro, 10 km S of Saraguro, *Luteyn et al.* 6646 (NY); Parque Nacional Podocarpus, above Nudo de Cajanuma around “Centro de Información,” *Madsen & Ellemann* 75243 (AAU, LOJA, QCNE), *Madsen* 85581 (AAU, LOJA); road Pichig–Fierro Urco, Km 11 (app. 15 km SW of Saraguro), *Madsen* 85444 (AAU, LOJA, QCA, QCNE); Parque Nacional Podocarpus, S of Loja, E of Nudo de Cajanuma, *Øllgaard et al.* 57862 (AAU, QCA); Cebadal, near Loja, *Poort-mann* 281 (P-2 sheets); Parque Nacional Podocarpus, above Nudo de Cajanuma around “Centro de Información,” *Ríos* 197 (AAU); Loma del Oro, S of Saraguro *Ulloa U.* 196 (AAU, QCA).—MORONA-SANTIAGO: Campamento San Miguel, road in construction Sigsig–Gualaquiza, *Harling et al.* 8124 (GB, SEL).—ZAMORA-CHINCHIPE: Parroquia Palanda, Valladolid, southern slopes of the Cordillera de Sabanilla, headwaters of Río Chinchipe, Tapachilaca Reserve, Fundación Jocotoco, *Clark & Mendoza* 8100 (AAU, E, MO, NY, QCA, QCNE, SEL, US), *Clark et al.* 9025 (LOJA, MO, QCA, QCNE, UNA, US); Cantón Gualaquiza, Cordillera Morire, unfinished road towards San Miguel de los Cuyes, *J. Glossoloma altescandens is distinctive by its erect subshrub habit (rarely epiphytic), terminally clustered leaves, brilliantly red calyx, and bright yellow corollas (rarely red) with strong red spotting in the throat (see frontispiece). The same suite of characters is also present in *G. martinianum*, but the leaves are lanceolate and densely tomentose in contrast to the ovate leaves with strigose pubescence in *G. altescandens*. Additionally, these species are geographically isolated (Figs. 7, 19). *Glossoloma altescandens* is restricted to the eastern Andean slopes of southern Ecuador and northern Peru at higher elevations (> 2300 m); in contrast, *G. martinianum* is more broadly distributed along the eastern Andes from northern Ecuador to northern Peru at lower elevations (<2500 m).

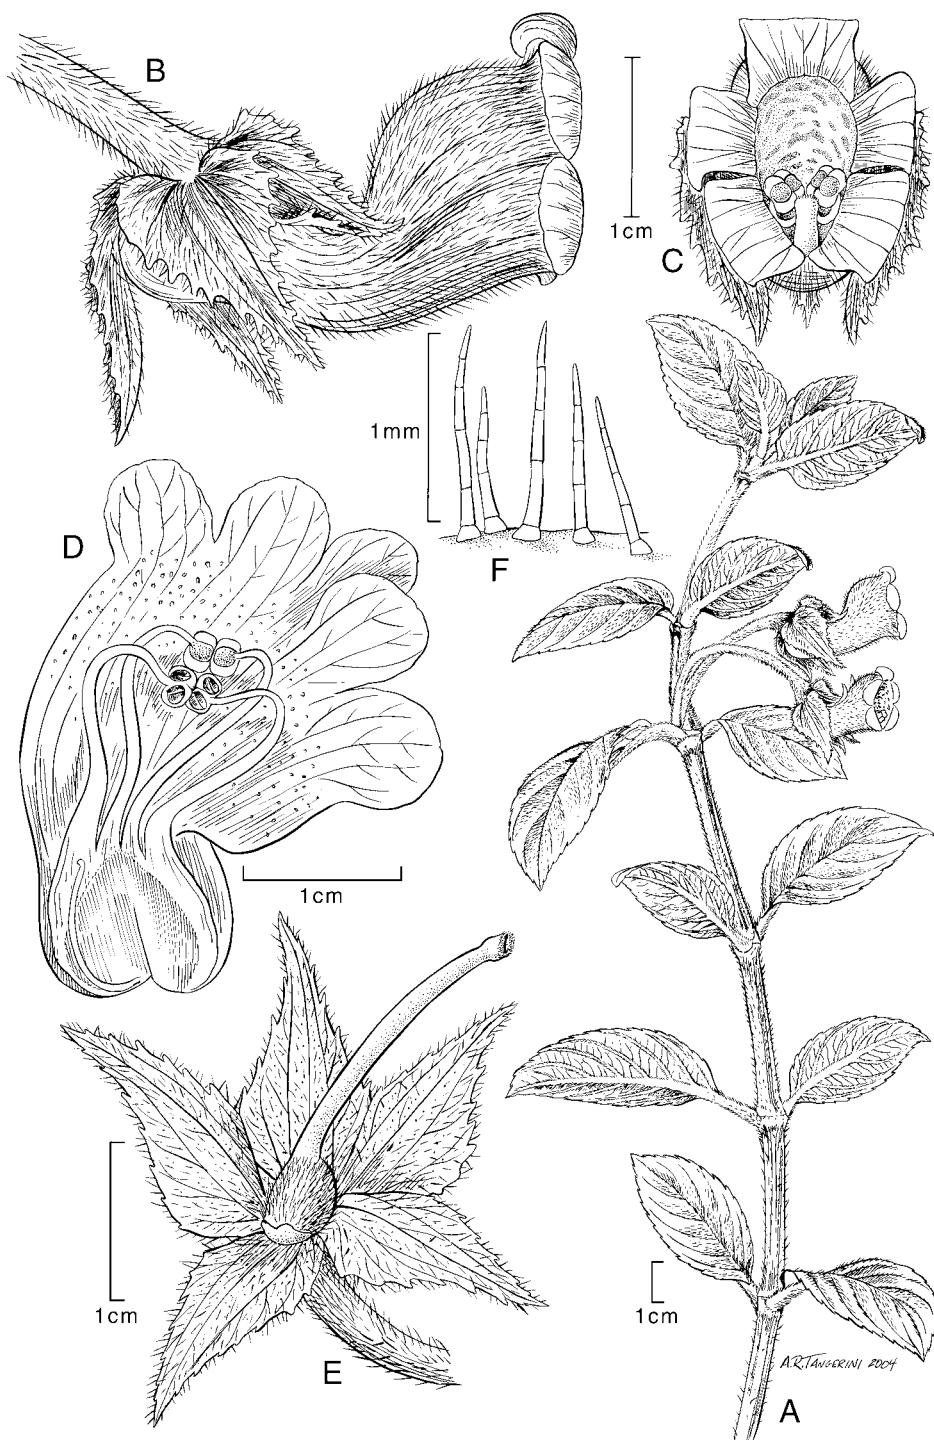

FIG. 6. *Glossoloma altescandens*. A. Habit. B. Side view of flower. C. Face view of flower. D. Corolla opened to show stamens. E. Calyx opened and corolla removed to show pistil and bilobed nectary gland. F. Trichomes on outer surface of corolla. (Based on J. L. Clark & C. Morocho 5847, neotype.)

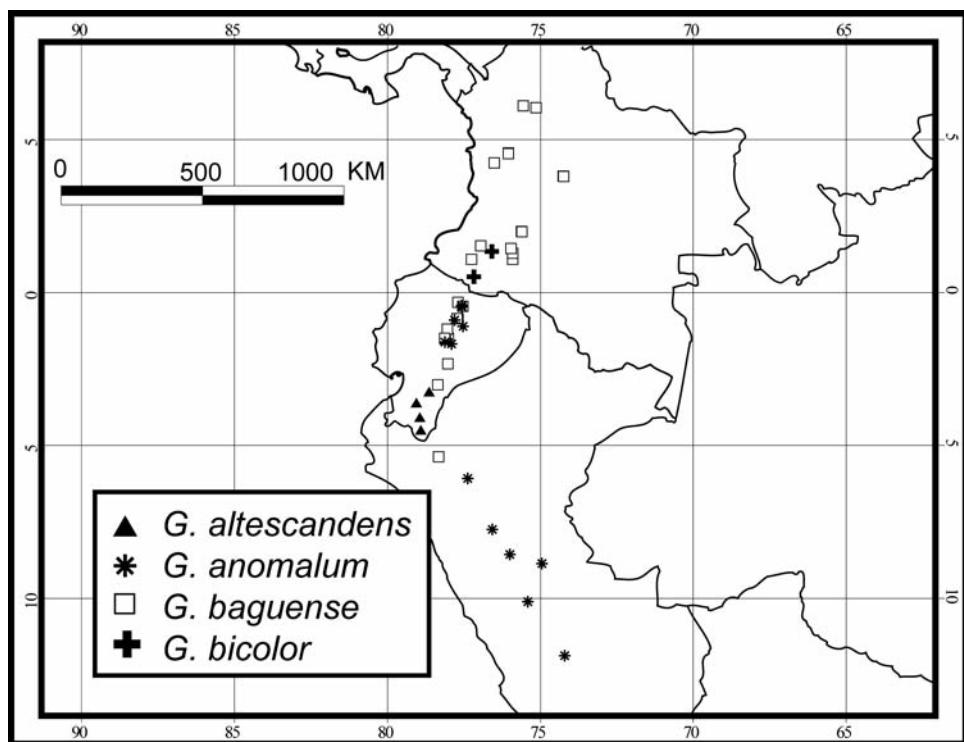

FIG. 7. Distribution of *Glossoloma altescandens*, *G. anomalum*, *G. baguense*, and *G. bicolor*.

The most abundant populations of *G. altescandens* were found in cloud forests in the Tapichala Reserve on the southeastern slopes of the Ecuadorian Andes in the province of Zamora-Chinchipe. A small population was collected in the Cordillera Morire (the “I will die ridge”) along a path leading towards the community San Miguel de Los Cuyes. A recent visit to the latter site in 2007 showed a dramatic decrease in the remaining forests, compared to a previous visit in 2003, owing to recent road building activities, and it was difficult to locate remnant populations. A third population may exist in the community-owned forest “Bosque Nativo Hushapampa” located 6 km south of Saraguro in the Loja province of Ecuador, but visits in 2003 and 2005 to locate fertile material for accurate determination were unsuccessful.

Mansfeld compared *G. altescandens* to a species he cited as “*Alloplectus tigrinus* Hemsley,” which is probably an error for *Alloplectus* (= *Crantzia*) *tigrinus* Karsten; Hemsley did not publish such a name.

It was not possible to select a neotype from the type locality of *G. altescandens*, because few collections are available for study from the Río Marañón area from the Department of Loreto in northern Peru. Loan material from 24 herbaria and visits to 18 herbaria, including a recent visit to the Universidad San Marcos herbarium (USM) in Lima, Peru, did not yield a collection from the type locality that could adequately represent Mansfeld’s description of *Alloplectus altescandens*. The specimen chosen as neotype of this species represents a taxon commonly collected throughout southern Ecuador. Future fieldwork in northern Peru will likely result in the documentation of this species from the type locality.

2. *Glossoloma anomalum* J. L. Clark, sp. nov.—TYPE: ECUADOR. Napo: Cantón Archidona, hwy between Baesa and Loreto, 3–5 km E of Tena–Baesa junction, 1100 m, 27 Feb 2003, *J. L. Clark & N. Harris* 7300 (holotype: QCNE!; isotypes: AAU! COL! CUZ! F! K! MO! NY! QCA! QCNE! SEL! US! USM!).

Ab omnibus congeneribus floribus non resupinatis differt.

Subshrubs, terrestrial; stems erect, unbranched, to 1.5 m tall, to 1 cm in diameter, usually woody, herbaceous when young, internodes 5–10 cm long, quadrangular, densely hirsute, leaf scars slightly raised from the stem surface. Leaves opposite, equal or subequal in a pair; petioles 3–11 cm long, pilose; blades 14–25 cm long, 7–12 cm wide, ovate to elliptic, base usually oblique, sometimes rounded, apex acute, margin serrate, adaxially pale green, pilose, abaxially pale green to yellow, pilose (especially on veins), membranous when dry, lateral veins 6–8 per side. Inflorescence not pedunculate, flowers appearing fasciculate, non-resupinate, with 1–3 flowers per axil, posture horizontal to erect at anthesis, bracteoles 10 mm long, 5 mm wide, linear; pedicels shorter than the petiole, 1–2 cm long, densely hirsute, pedicel enations present. Calyx lobes nearly free, each appressed to adjacent lobe, folded lengthwise with the margin curved inward, erect, nearly equal, 15 mm long, 10 mm wide, ovate, base truncate, apex acute, margin fimbriate, light yellow to green, densely hirsute. Corolla 1.5–2.5 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla oblique relative to calyx; base 4 mm, middle ampliate, becoming apically ventricose on lower surface, throat slightly constricted, not appearing laterally compressed, 2–3 mm wide (at mouth), outside densely hirsute, inside mostly glabrous, with glandular trichomes at throat, interior spotting absent, limb reflexed, subregular, 2–4 mm wide, base white, otherwise uniformly red or uniformly yellow, lobes nearly equal, 1.5 mm long, 2 mm wide, rotund, entire. Nectary gland bilobed, on dorsal surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 1.5 cm long, adnate to base of corolla tube for ca. 3 mm, connate for 1 mm, forming an open sheath, glabrous; anthers 1.5 mm long, 2 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 6 mm long, ca. 4 mm wide, ovoid, sericeous, style 1.2 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent when ripe, 1.5 cm long, 1.0 cm in diameter, ovoid when immature, pilose, loculicidally dehiscent, becoming bivalved, valves not reflexed, reaching a 45° angle when mature. Seeds numerous, ca. 1 mm long, ca. 0.3 mm wide, ellipsoid, longitudinally striate, light red. Frontispiece; Fig. 8.

Phenology. Collected in flower during February to April, and June to December, and in fruit in May and December.

Distribution (Fig. 7). Ecuador (Napo, Pastaza, Sucumbíos, Tungurahua) and Peru (Amazonas, Ayacucho, Huánuco, San Martín, Junín); eastern Andean slopes in wet montane and premontane forests; 400–2100 m.

ADDITIONAL SPECIMENS EXAMINED. ECUADOR. NAPO: Cantón Archidona, Reserva Ecológica Antisana, Comunidad Shamato, Km 21 on road to Shamato, *Clark et al.* 5054 (QCNE, US); Cantón Archidona, Parroquia Catundo, buffer zone of Parque Nacional Sumaco Napo Galeras, trail from the Comunidad Mushullacta towards crest of Galeras, *Clark & Harris* 7260 (NY, QCNE, SEL, UNA, US); 4 km W of Cosanga, *Harling & Andersson* 16461 (GB, US); road Baesa–Lago Agrio, *Øllgaard* 35689 (AAU); road to Salto San Rafael from Lago Agrio, along Río Quijos, *Smith & Dunn* 3418 (US).—PASTAZA: Cantón Mera, Parroquia Shell, road to Río Anzu and beyond, S of Mera, *Clark et al.* 7781 (AAU, BM, CAS, COL, E, F, K, MO, NY, QCA, QCNE, SEL, UNA, US); Mera, along Río Pindo, *Harling & Andersson* 17344 (GB, US); road Baños–Puyo, W of Mera, *Kvist* 60337 (US); Arajuno, *Lugo S.* 5753 (GB, US); road Puyo–Macas, ca. 15 km SE of Puyo, *Lugo S.* 4715 (GB, SEL, US).—SUCUMBÍOS: Reserva Ecológica Cayambe Coca, Volcán Reventador, trail between Río Quijos and refugio, *Clark* 4465 (QCNE, US).—TUNGURAHUA: Cantón Baños, Parroquia Río Negro, near Río Topo, *Clark & Duran* 6020

Glossoloma anomalum is distinguished from all other species by its non-resupinate flowers. This taxon represents a unique example in the Gesneriaceae as the only species with a non-resupinate flower orientation embedded in a clade of species with resupinate flower orientation (Fig. 3). For example, *Nematanthus*, *Crantzia*, and *Kohleria* Regel have resupinate and non-resupinate flowers, but the trait in these genera has not evolved as a single-species autapomorphy. Other differences that set *G. anomalum* apart from congeners are the shallow fimbriate calyx lobe margins, the densely hirsute vestiture on the stems, and an erect unbranched subshrub habit.

3. *Glossoloma baguense* (L. E. Skog) J. L. Clark, Selbyana 25: 198. 2005. *Alloplectus baguensis* L. E. Skog, Opera Bot. 92: 225. 1987.—TYPE: PERU. Amazonas: Bagua, Cordillera Colón, ca. 25 km (by trail) E of La Peca, along stream, 1894 m, 13 Aug 1978, *P. Barbour* 2973 (holotype: US!; isotypes: C! MO!).

Herbs to subshrubs, terrestrial or epiphytic; stems scandent, rarely branched, 1 m tall, 5–8 mm in diameter, subwoody, internodes usually 5–7 cm long, subquadrangular, glabrous, leaf scars raised from stem surface. Leaves opposite, equal or subequal in a pair; petioles 1.0–3.5 cm long, glabrous and occasionally verrucose; blades 6.9–18 cm long, 2.4–6.5 cm wide, elliptic to narrowly obovate, base cuneate to acute, sometimes oblique, apex acuminate, margin entire to remotely serrulate, slightly revolute, adaxially and abaxially yellowish green and glabrous, subcoriaceous when dry, lateral veins 7–8 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–2 flowers per node, posture horizontal at anthesis, bracteoles inconspicuous, green, margin entire, early caducous; pedicels longer than petiole, 1.6–5.5 cm long, glabrous, pedicel enations present. Calyx lobes nearly free, imbricate, erect, nearly equal, 10–18 mm long, 6–14 mm wide, ovate, base truncate, apex acute to obtuse, margin entire, usually green, rarely red, abaxially glabrous, adaxially glabrous except pilose at base. Corolla 3.5–5.0 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla oblique relative to calyx; base 5–8 mm in diameter, middle sometimes constricted with slight bend, but usually ampliate and becoming ventricose on upper surface, throat not constricted, appearing laterally compressed, to 1.1 cm wide (at mouth), outside glabrous becoming sparingly pilose distally, inside mostly glabrous, with glandular trichomes at throat, interior spotting absent, limb spreading, zygomorphic, 5–8 mm wide, red, lobes nearly equal, 3–5 mm long, 4–6 mm wide, rotund, entire. Nectary gland bilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion 2.5–4.5 cm long, adnate to base of corolla tube for 3 mm, connate for 2–4 mm, forming an open sheath, glabrous; anthers ca. 1 mm long, ca. 2 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary 6.4 mm long, 4.5 mm wide, ovoid, pilose, style ca. 4 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent when ripe, 1.5 cm long, 1.3 cm in diameter, ovoid when

immature, pilose, loculicidally dehiscent, becoming bivalved, valves reflexed, reaching a 180° angle when mature. Seeds numerous, ca. 1 mm long, 0.3–0.5 mm wide, elongate-fusiform. Figs. 5C, D, 9.

Phenology. Collected in flower and fruit throughout the year.

Distribution (Fig. 7). Colombia (Antioquia, Caquetá, Cauca, Chocó, Cundinamarca, Huila, Nariño, Putumayo, Risaralda), Ecuador (Morona-Santiago, Napo, Tungurahua, Zamora-Chinchipe), and Peru (Amazonas); eastern and western Andean slopes in montane and premontane forests; 1400–2700 m.

ADDITIONAL SPECIMENS EXAMINED. **Colombia.** ANTIOQUIA: Mpio. Yarumal, Vereda El Colgadero, *Lozano C.* 2173 (COL); Mpio. Glossoloma baguense resembles *G. herthae* (no. 11), but is distinguished from it by the evenly spaced leaves, longer pedicels, and glabrous leaves. Other characters that are useful for distinguishing *G. baguense* are elongate stems, few (1–2) flowers per axil, oblong glabrous leaves, and tubular corollas. The angulate or slight bend in the corolla (Fig. 9D) is a character limited to the collections made by Barbour at the type locality of the Bagua province in Peru. Figure 9 is reproduced from the protologue (Skog 1987), which was solely based on material from Peru. Recent collections of *G. baguense* from Colombia and Ecuador differ from the Peruvian specimens by the smooth petioles, in contrast to

FIG. 9. *Glossoloma baguense*. A. Habit. B. Detail showing node. C. Calyx. D. Flower. E. Corolla in longitudinal section showing stamens. F. Calyx opened and corolla removed to show pistil and bilobed nectary gland. (Based on: A, B, P. Barbour 2973, holotype; C, P. Barbour 3836; D, E, P. Barbour 2747, 3836; F, P. Barbour 2747.) Reprinted with permission from *Opera Botanica* (Skog 1987: Fig. 2).

verrucose petioles, and straight corollas, in contrast to the slightly bent or angulate corollas (Fig. 9D). The angulate corolla shown in the illustration from the protologue (Skog 1987) could be a result of how the flower was field-pressed and preserved on the herbarium specimen. Comparison of the specimens from Colombia, Ecuador, and Peru showed them similar enough that this species's geographic range is here greatly expanded.

4. *Glossoloma bicolor* (Kunth) J. L. Clark, Selbyana 25: 198. 2005. *Besleria bicolor* Kunth, Nov. gen. sp. pl. 2: 398 (folio), 319 (quarto). 1818 ["1817"]. *Alloplectus kunthii* G. Don, Gen. hist. 4: 655. 1838 ["1837"], nom. superfl. *Alloplectus bicolor* (Kunth) G. Don in Loudon, Encycl. pl., new ed. 1401. 1855 [the combination also proposed by Klotzsch ex Hanstein, Linnaea 34: 377. 1865]. *Columnea bicolor* (Kunth) Kuntze, Rev. gen. pl. 2: 472. 1891. *Crantzia bicolor* (Kunth) Fritsch, Bot. Jahrb. Syst. 29 (Beibl. 65): 9. 1900.—TYPE: COLOMBIA. Cauca: Villa La Erre, plains of Sacandonoy between town of Almaguer and Pasto, 1829–2195 m, Nov 1801, A. Bonpland 2118 (holotype: P!, holotype fragment: F!).

Subshrubs, terrestrial; stems erect, unbranched, 1.5 m tall, 6–8 mm in diameter, subwoody, internodes 2–6 cm long, subquadangular, glabrescent proximally, hirsute with yellowish hairs distally, leaf scars slightly raised from the stem surface. Leaves opposite, equal or subequal in a pair; petioles 2–4 cm long, pilose; blades 12–23 cm long, 4–10 cm wide, ovate, base rounded, apex acute, margin serrate, adaxially green, densely hirsute-pilose, abaxially red, pilose, subcoriaceous when dry, lateral veins 7–8 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 4–10 flowers per node, posture horizontal to erect at anthesis, bracteoles 5 mm long, 2 mm wide, linear; pedicels shorter than petiole, to 1 cm long, pilose, pedicel enations present. Calyx lobes nearly free, plane, erect, nearly equal, 6 mm long, 2 mm wide, linear, base truncate, apex acute, margin entire, light green, abaxially pilose, adaxially glabrous. Corolla 2 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla oblique to perpendicular relative to calyx; base 3–4 mm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat constricted, not appearing laterally compressed, to 3 mm wide (at mouth), outside sparingly pilose, inside glabrous, interior spotting absent, limb reflexed, zygomorphic, to 3 mm wide, lobes nearly equal, 1 mm long, 1 mm wide, rotund, entire. Nectary gland bilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 1.3 cm long, adnate to base of corolla tube for 3 mm, connate for 1–3 mm, forming an open sheath, glabrous; anthers ca. 1 mm long, ca. 2 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary 2.5 mm long, 2 mm wide, ovoid, pilose, style 1.4 cm long, glabrous, stigma stomatomorphic. Fruit not seen.

Phenology. Collected in flower during October.

Distribution (Fig. 7). Colombia (Nariño); western Andean slopes in montane forests; 2000–2500 m.

ADDITIONAL SPECIMEN EXAMINED. **Colombia.** NARIÑO: Mallama, "trayecto piedrancha-cabeceras," La Chorrer, Ramírez P. & Jojoa 5755 (US).

Glossoloma bicolor is unique in the genus in having small flowers (ca. 2 cm) that are dorsally red and ventrally yellow. The only other species in the genus with dorsally yellow and ventrally red flowers is *G. ichthyoderma*, which differs by the significantly larger flowers (2.5–3.2 cm). In addition, the stems of *G. ichthyoderma* have an exfoliating scale-like epidermis (Fig. 20B), unlike the glabrescent stems of *G. bicolor*.

5. *Glossoloma boliviannum* (Britton ex Rusby) J. L. Clark, Selbyana 25: 198. 2005.

Columnea bolivianna Britton ex Rusby, Mem. Torrey Bot. Club 4: 238. 1895. *Alloplectus boliviannus* (Britton ex Rusby) Wiegler, Phytologia 27(5): 327. 1973.—TYPE: BOLIVIA. La Paz: Yungas, Oct 1890, *Bang* 515 (holotype: NY!; isotypes: BM! E! F! GH-2 sheets! K! MANCH, MO! NY! PH! US-2 sheets! W! WU; fragment: F!; photos of MANCH and WU isotypes: US!).

Shrubs, terrestrial; stems usually erect, occasionally horizontal on vertical embankments, rarely branched, 1–2 m tall, 5–10 mm in diameter, woody, internodes 2–10 cm long, subquadrangular, glabrescent proximally, sparingly to densely pilose distally, leaf scars slightly raised from the stem surface, enations at base of petiole present. Leaves opposite, equal or subequal in a pair; petioles 2–5 cm long, strigose; blades 10–18 cm long, 5–8 cm wide, broadly ovate, rarely elliptic, base acute, apex acuminate, margin serrulate, adaxially dark green, hirsute, sometimes glabrous, abaxially yellowish green, sericeous, subcoriaceous when dry, lateral veins 6–8 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–2 flowers per node, posture pendent at anthesis, bracteoles 20 mm long, 5 mm wide, linear; pedicels shorter than petiole, 1–3 cm long, densely strigose, pedicel enations present. Calyx lobes imbricate, nearly free, plane, erect, 4 subequal, 10–15 mm long, 5–10 mm wide, rotund, base truncate, apex obtuse, margin serrulate, greenish yellow, abaxially hirsute, adaxially hirsute; fifth (ventral) lobe smaller and narrower, to 1 cm long, to 0.5 cm wide, elliptic-lanceolate. Corolla 2–3.5 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla perpendicular relative to calyx; base 5–10 mm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat slightly constricted, appearing laterally compressed, to 8 mm wide (at mouth), outside densely pilose, inside mostly glabrous, with glandular trichomes at throat, interior spotting absent, limb reflexed, zygomorphic, to 1 cm wide, yellow, lobes nearly equal, to 2 mm long, to 2.5 mm wide, rotund, entire. Nectary gland bilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 1.0 cm long, adnate to base of corolla tube for 3 mm, connate for 2 mm, forming an open sheath, glabrous; anthers ca. 1 mm long, ca. 2 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary to 7 mm long, to 5 mm wide, ovoid, densely pilose, style ca. 1.5 cm long, glabrous, stigma stomatomorphic. Fruit not seen. Fig. 10.

Phenology. Collected in flower during January, February, and July.

Distribution (Fig. 11). Bolivia (La Paz, Cochabamba); eastern Andean slopes in montane forest; 750–2500 m.

ADDITIONAL SPECIMENS EXAMINED. **Bolivia.** COCHABAMBA: Antohuacuina, Espiritu Santo, *Buchtien* 4821 (US); Carrasco, Comunidad Karawasi, Serranias Siberia, N of old hwy Santa Cruz–Cochabamba, *Clark & Rodríguez* 6726 (E, LPB, MO, SEL, US); Chaparé, hwy Cochabamba–Villa Tunari, near Río San Jacinto, ca. Km 95–100, W of checkpoint, *Clark & Rodríguez* 6769 (AAU, LPB, MO, SEL, US).—LA PAZ: Mapiri, *Bang* 1551 (A, BM, E, F, G, GH-2 sheets, K, MO, NY-2 sheets, PH, US-2 sheets, W); Hacienda Simaco, above road to Tipuaní, *Buchtien* 5562 (NY, US), *Buchtien* 5563 (US); Larecaja, walk from Ingenio to Mapiri, day 4 of 5, campamento “Incapampa,” *Clark & Barrientos* 6693 (AAU, E, K, LPB, MO, NY, SEL, UNA, US); near Yungas, *Rusby* 1352 (NY); Mapiri, *Rusby* 2488 (NY-2 sheets).—SUD YUNGAS: Huancané, San Isidro, N of Chulamaní, *Beck* 8731 (LPB, US); Yungas, *Rusby* 2487 (F, NY, US).

Glossoloma boliviannum is distinguished from other members of the genus by the combination of the following characters: overlapping or imbricate calyx margins (Fig. 10D) instead of conduplicate calyx margins; corollas densely pilose (Fig. 10C, D); and large (> 10

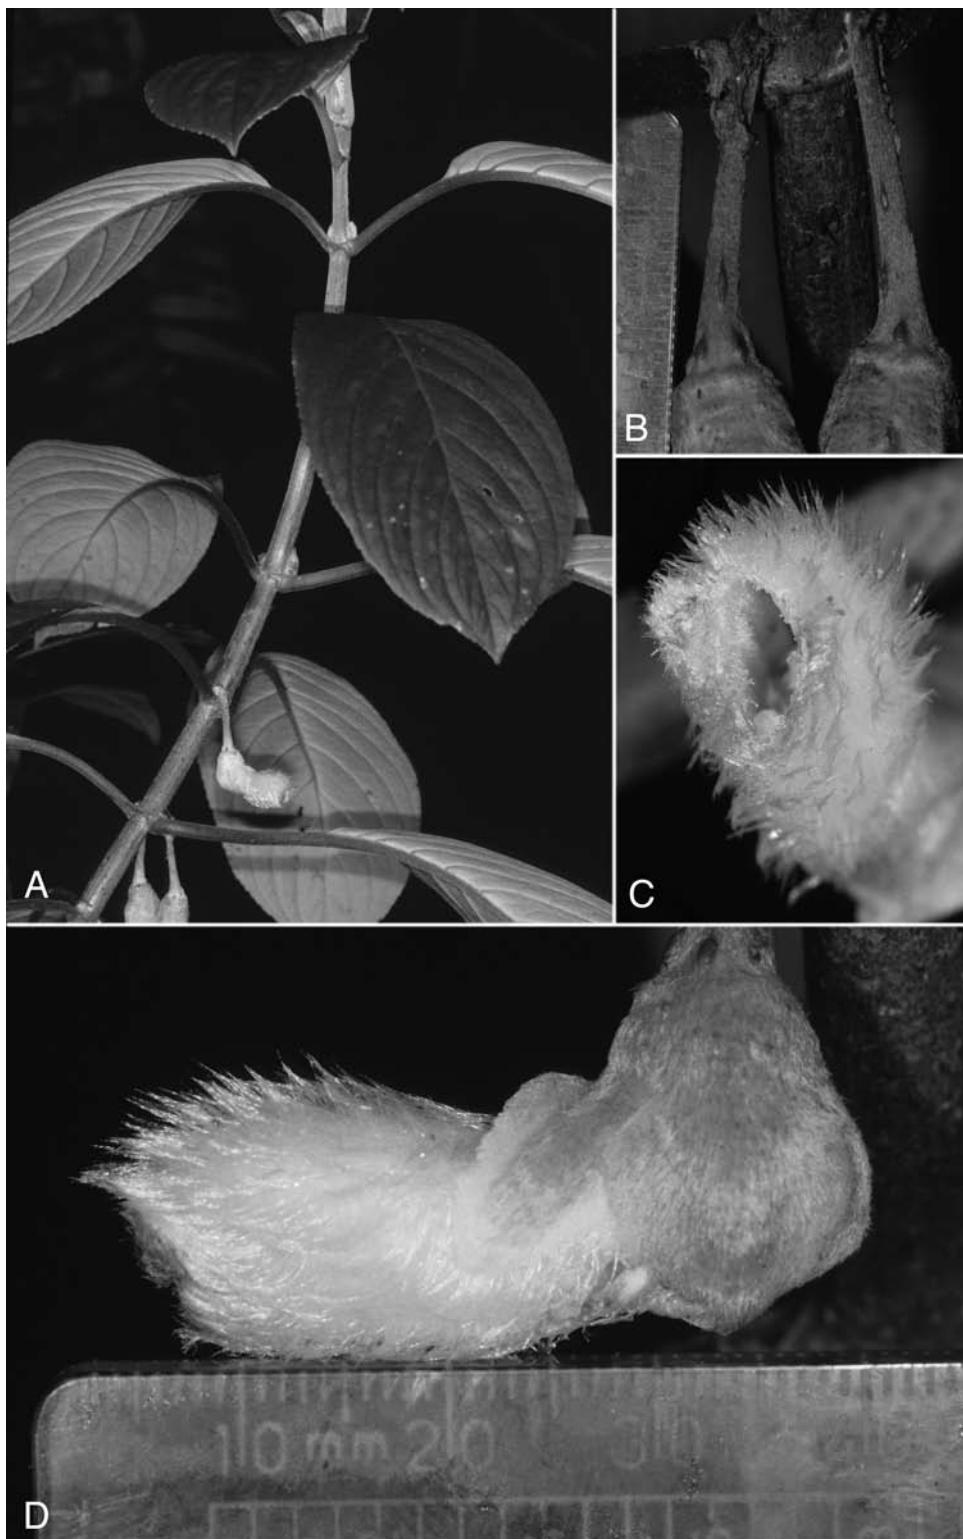

FIG. 10. *Glossoloma boliviianum*. A. Habit showing pendent posture of flower. B. Pedicel enations. C. Face view of corolla. D. Lateral view of corolla. (Photos by J. L. Clark; voucher: J. L. Clark 6693.)

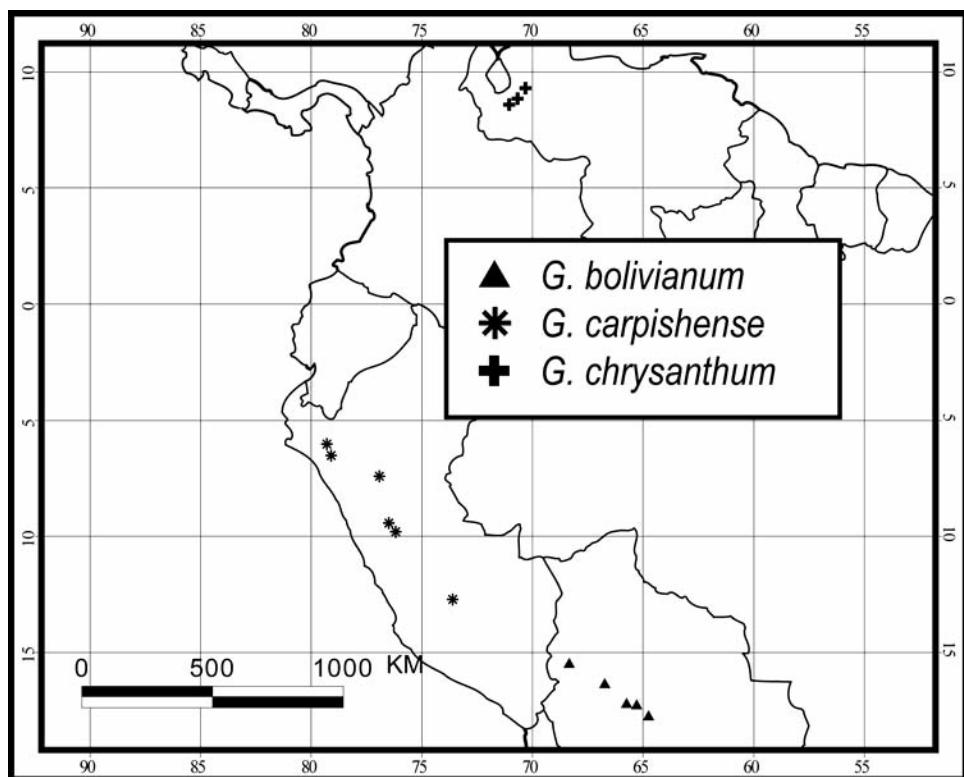

FIG. 11. Distribution of *Glossoloma bolivianum*, *G. carpishense*, and *G. chrysanthum*.

cm long) ovate leaves. Many herbaria have collections from Ecuador and Colombia annotated with this name, but recent fieldwork and the neotypification of *Glossoloma herthae* (Clark 2005) have resolved this taxonomic confusion (see *G. herthae*, no. 11, for further discussion). The geographic ranges of *G. herthae* and *G. bolivianum* do not overlap, but future fieldwork may show that these two species are sympatric in southern Peru. Both species share the unusual feature of imbricate calyx lobes, but the corollas of *G. bolivianum* are readily differentiated by their dense pilose pubescence when compared to the glabrescent to sparingly pilose corollas of *G. herthae*. The leaves of *G. bolivianum* are broadly ovate, and its habit is usually as a terrestrial shrub with erect stems, which are occasionally horizontal when growing on steep embankments. In contrast, the leaves of *G. herthae* are elliptic to slightly falcate, and the habit is usually an epiphyte growing on steep roadside embankments with pendent to horizontal stems.

6. *Glossoloma carpishense* (J. L. Clark & I. Salinas) J. L. Clark, Selbyana 25: 199. 2005.

Alloplectus carpishensis J. L. Clark & I. Salinas, Novon 15: 70. 2005.—TYPE: PERU. Huánuco: Dist. Chinchao, San Pedro de Carpish, above Carpish tunnel, ca. 47 km N of Huánuco on main road to Tingo María, 09°43'14"S, 76°06'53"W, 2770–2900 m, 1 Nov 2001, I. Salinas 224 (holotype: USM!; isotype: US!).

Subshrubs, terrestrial; stems usually erect or rarely horizontal on steep slopes, rarely branched, to 2 m tall, ca. 5 mm in diameter, subwoody, internodes 2–10 cm long,

subquadrangular, glabrescent proximally, densely villous distally, leaf scars slightly raised from the stem surface, enations at base of petiole present. Leaves opposite, equal or subequal in a pair; petioles 1–4 cm long, densely villous; blades 8–19 cm long, 2–5 cm wide, elliptic to oblong, base acute, apex acute, margin serrate, adaxially green, uniformly sericeous, abaxially pale green, densely sericeous (especially on veins), subcoriaceous when dry, lateral veins 6–8 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–4 flowers per node, posture pendent at anthesis, bracteoles 2–3 cm long, 1–2 cm wide, ovate; pedicels shorter or longer than the petiole, 1–4 cm long, densely villous, pedicel enations present. Calyx lobes conduplicate, the apex free and the base of each appressed to adjacent lobe, folded lengthwise with the margin curved inward, erect, subequal, 10–17 mm long, 6–12 mm wide, ovate, base truncate, apex acuminate, margin serrate, bright red, both surfaces sparsely to densely pilose. Corolla to 4 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla perpendicular relative to calyx; base 6–8 mm in diameter, middle ampulate, becoming apically ventricose on upper surface, throat constricted, appearing laterally compressed, to 1 cm wide (at mouth), outside densely pilose, inside with small glandular trichomes, red spotting present on the upper surface of the throat, limb reflexed, zygomorphic, to 1 cm wide, yellow, lobes nearly equal, to 3 mm long, to 3 mm wide, rotund, entire. Nectary gland deeply bilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 1.9 cm long, adnate to base of corolla tube for 8 mm, connate for 1 mm, forming an open sheath, glabrous; anthers ca. 2 mm long, ca. 3 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary to 6 mm long, to 5 mm wide, ovoid, densely pilose, style ca. 2.5 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent when ripe, 1.5 cm long, 1.5 cm wide, ovoid when immature, pilose, loculicidally dehiscent, becoming bivalved, valves reflexed, reaching a 180° angle when mature. Seeds numerous, fusiform, 1 mm long, 0.3 mm wide, longitudinally striate, dark brown. Frontispiece; Fig. 12.

Phenology. Collected in flower January through August, in fruit from June through November.

Distribution (Fig. 11). Peru (Cajamarca, Cuzco, Huánuco, San Martín); eastern Andean slopes; 2200—3000 m.

ADDITIONAL SPECIMENS EXAMINED. **Peru.** CAJAMARCA: Jaén, Sallique, Lanchal, La Cocha, Díaz *et al.* 9657 (US); Jaén, Pomahuaca, Aguas Verdes, Díaz & Campos 10876 (US); Chota, WNW of Huambos, Dillon *et al.* 6438 (F, US).—CUZCO: Dto. Mariscal Cáceres, Parque Nacional Río Abiseo, near Gran Pajaten ruins, Young 1260 (F).

Glossoloma carpishense is distinguished by the combination of the following characters: densely pubescent and elliptic leaves, uniformly bright yellow corollas, and a variable

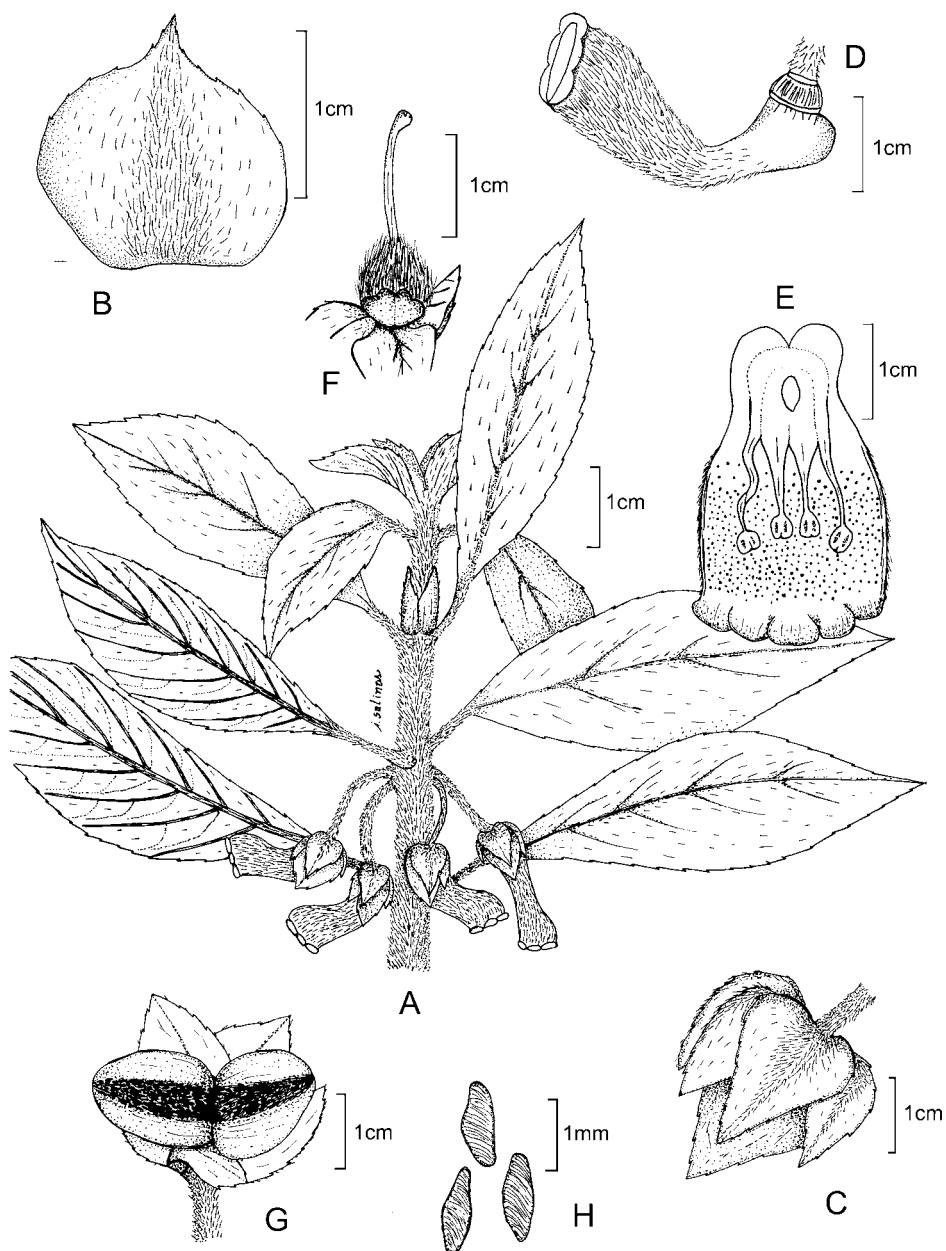

FIG. 12. *Glossoloma carpishense*. A. Habit. B. Calyx lobe. C. Calyx. D. Corolla. E. Corolla opened to show stamens. F. Calyx opened and corolla removed to show pistil and valvate nectary gland. G. Mature fruit. H. Seeds. (Based on Salinas 224, holotype.) Reprinted with permission from *Novon* (Clark et al. 2005: Fig. 1).

shaped nectary gland. The nectary varies from a single bilobed gland to two separate valvate glands (Fig. 12F) instead of the more common single bilobed gland found in most other species of *Glossoloma*. *Glossoloma carpishense* is often confused with the similar appearing *G. ichthyoderma*, which differs in its exfoliating scale-like epidermis (Fig. 20B) and yellow corollas with a dorsal red stripe; *G. carpishense* lacks an exfoliating epidermis, and the corollas are uniformly bright yellow. *Glossoloma carpishense* has ovate calyx lobes with an acuminate apex (Fig. 12F), which separate it from *G. serpens*, which has oblong calyx lobes with a rounded apex (Fig. 34E).

TYPE: based on living plants; authentic material unknown.—VENEZUELA. Mérida: dirt road towards páramo de Mucumbis, between Torondoy and Pico AgUILA, near entrance to Parque Nacional Culata, 2800–2900 m, 16 Oct 2002, J. L. Clark & S. Yustiz 6872 (neotype, designated by Clark, 2005: VEN!; isoneotypes: MER! MO! NY! PORT! SEL! US!).

Alloplectus ornatus C. V. Morton, Fieldiana, Bot. 28(3): 523. 1953.—TYPE:

VENEZUELA. Trujillo: La Quebrada Cortijo, in dense woods below Páramo and ridge top, by boundary line Lara–Trujillo, above Humocaro Bajo, 2600–2800 m, 6 Feb 1944, J. A. Steyermark 55355 (holotype: US!; isotypes: F! NY! VEN!).

Subshrubs, terrestrial or epiphytic; stems scandent and often reclining on ground with ascending tips, sparingly branched, to 5 m long, 3–8 mm in diameter, subwoody, internodes 1–8 cm long, subquadrangular, pilose, leaf scars raised from stem surface, enations at base of petiole absent. Leaves opposite, equal or subequal in a pair; petioles 1.6–3 cm long, densely pilose; blades 8–16 cm long, 3–6 cm wide, elliptic to oblong, base acute, sometimes oblique, apex acuminate, margin serrate, adaxially dark green, uniformly hirsute, abaxially yellowish green, hirsute to densely pilose (especially on veins), subcoriaceous when dry, lateral veins 4–5 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–2 flowers per node, posture pendent at anthesis, bracteoles not seen; pedicels equal to or slightly longer than the petiole, to 2.5 cm long, pilose, pedicel enations present. Calyx lobes conduplicate, the apex free and the base of each appressed to adjacent lobe, folded lengthwise with the margin curved inward, erect, 4 subequal, to 15 mm long, to 5 mm wide, broadly ovate, base truncate, apex acute, margin serrate, bright red, both surfaces sparsely to densely pilose. Corolla to 3.5 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla perpendicular relative to calyx; base ca. 5 mm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat constricted, appearing laterally compressed, to 8 mm wide (at mouth), outside densely pilose, inside glabrous, interior spotting absent, limb reflexed, zygomorphic, to 1 cm wide, yellow, lobes nearly equal, ca. 1 mm long, ca. 1.5 mm wide, rotund, entire. Nectary gland deeply bilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 1.5 cm long, adnate to base of corolla tube for 3 mm, connate for 1 mm, forming an open sheath, glabrous; anthers ca. 1.5 mm long, ca. 2 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary to 4 mm long, to 3 mm wide, ovoid, densely pilose, style ca. 1.5 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent when ripe, 1.5 cm long, 1.3 cm wide, ovoid when immature, pilose, loculicidally

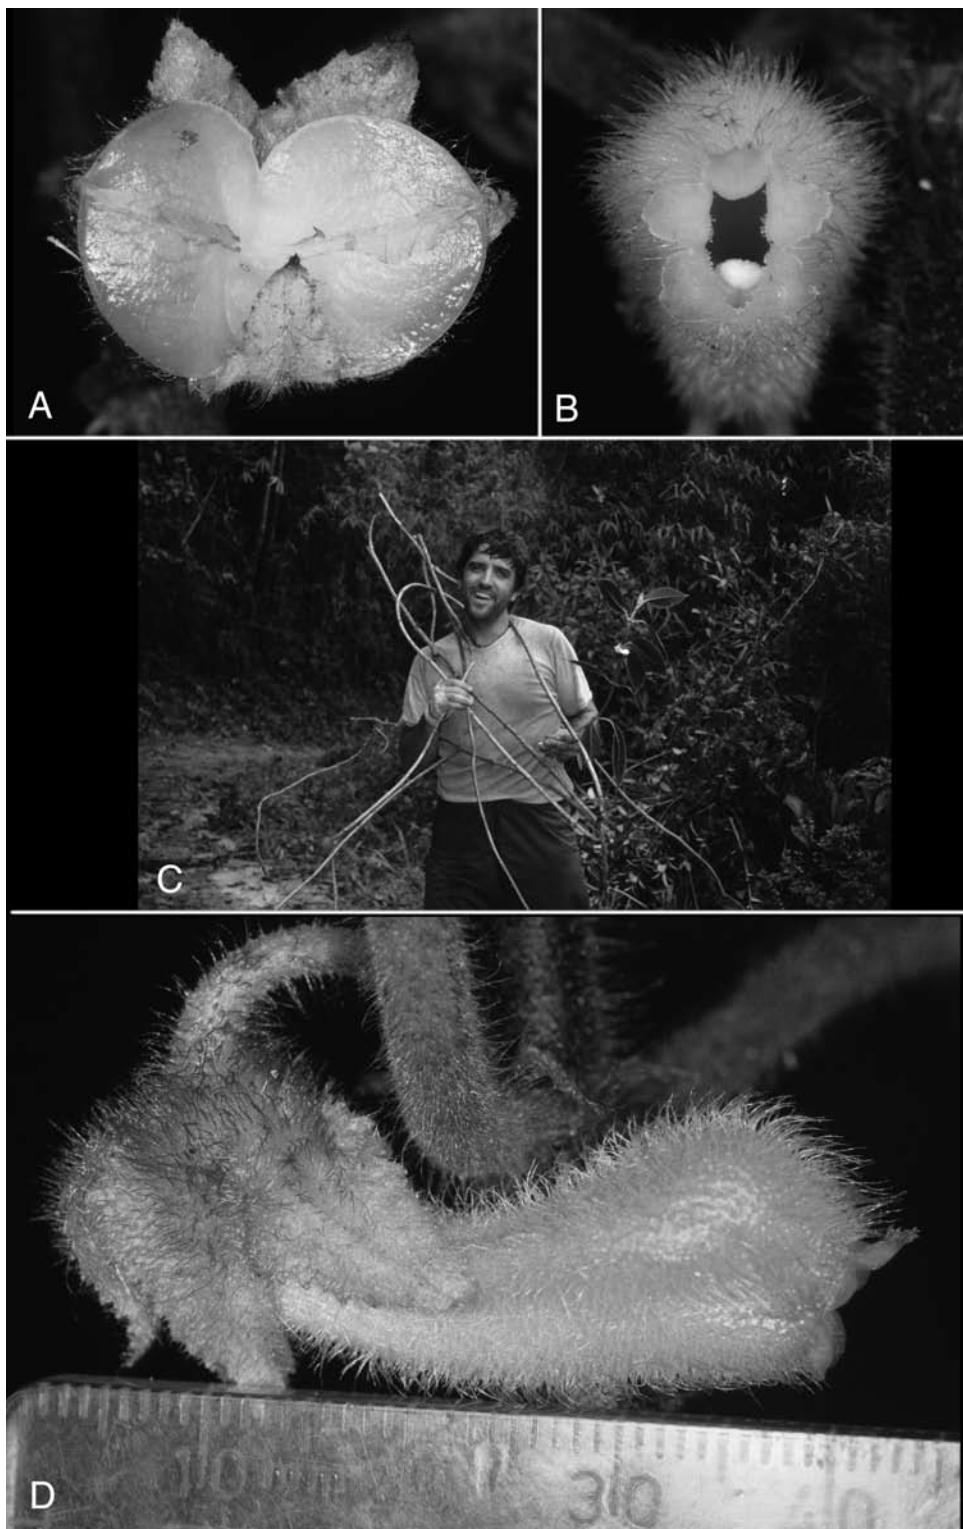

FIG. 13. *Glossoloma chrysanthum*. A. Capsular fruit with fully reflexed valves; seeds absent. B. Anterior view of corolla. C. Habit showing elongate decumbent stems (> 5 meters long) and erect shoot (ca. 1 m tall). D. Lateral view of corolla. (Photos by J. L. Clark; voucher: J. L. Clark 6872.)

dehiscent, becoming bivalved, valves reflexed, reaching a 180° angle when mature. Seeds numerous, 1 mm long, 0.3 mm wide, ellipsoid, longitudinally striate, dark brown. Fig. 13.

Phenology. Collected in flower during February to April, June, July, and October, in fruit during October.

Distribution (Fig. 11) Venezuela (La Mucuy, Lara, Mérida, Trujillo); Andean slopes in montane forest; 1700–2900 m.

Glossoloma chrysanthum is distinguished from its congeners by its elongate stems that can reach 5 m in length (Fig. 13C). These elongate stems have ascending tips or erect shoots bearing terminally clustered leaves. The unusually long stems are sometimes difficult to detect, because they grow in the underbrush of thick groves. The abaxial leaf surface of *G. chrysanthum* is reddish to green, and the corolla is uniformly yellow. Herbarium specimens of this species have been incorrectly attributed to commonly collected yellow-flowered species of *Glossoloma* in Ecuador (e.g., *G. herthae*) and Bolivia (*G. bolivianum*). The short stems of *G. herthae* and *G. bolivianum* differ considerably from the elongate stems of *G. chrysanthum*. Although the flowers of *G. bolivianum*, *G. chrysanthum*, and *G. herthae* appear similar, these three species are easily differentiated by their geographic distribution, habit, and calyx lobe arrangement. The calyx lobes in *G. chrysanthum* (Fig. 13D) are conduplicate in contrast to the imbricate lobes in *G. bolivianum* (Fig. 10D) and *G. herthae* (Fig. 18B, D).

8. *Glossoloma cucullatum* (C. V. Morton) J. L. Clark, Selbyana 25: 200. 2005. *Alloplectus cucullatus* C. V. Morton, Contr. U.S. Natl. Herb. 29: 36. 1944.—TYPE: GUATEMALA. Quiché: Zona Reyna, 750–900 m, 2 Dec 1934, A. F. Skutch 1812 (holotype: US!; isotypes: A, F!).

Alloplectus cucullatus var. *substrigosus* C. V. Morton, Contr. U.S. Natl. Herb. 29: 37. 1944.—TYPE: GUATEMALA. Alta Verapaz: Pansamalá, 1150 m, Jun 1885, H. von Tirckheim 733 (holotype: US!; isotypes: GH! NY! PH! US!).

Subshrubs, terrestrial; stems erect, unbranched, to 2 m tall, to 1.3 cm in diameter, succulent, becoming woody, internodes 2–10 cm long, quadrangular, glabrescent proximally, hirsute with yellowish hairs distally, leaf scars raised from stem surface, enations at base of petiole present. Leaves opposite, equal or subequal in a pair; petioles 4–10 cm long,

sparserly pilose; blades 15–27 cm long, 6–12 cm wide, broadly ovate, base cuneate or acute, apex acuminate, margin serrate, adaxially green, uniformly pilose, abaxially pale green, uniformly pilose to densely pilose on venation, membranous when dry, lateral veins 6–8 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–4 flowers per node, posture pendent at anthesis, bracteoles 5 mm long, 4 mm wide, ovate; pedicels shorter than the petiole, to 2 cm long, densely pilose, pedicel enations absent. Calyx lobes nearly free, each appressed to adjacent lobe, folded lengthwise with the margin curved inward, erect, subequal, cucullate, to 20 mm long, to 15 mm wide, broadly ovate, base shallowly cordate, apex acute, margin laciniate, red, abaxially pilose with the midvein densely pilose, adaxially pilose near middle, otherwise glabrous. Corolla to 6 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla oblique relative to calyx; base ca. 3 mm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat not constricted, appearing laterally compressed, 1.2 cm wide (at mouth), outside pilose, inside mostly glabrous, with glandular trichomes at throat, interior spotting absent, limb spreading, zygomorphic, ca. 1.4 cm wide, uniformly red or yellow, lobes nearly equal, ca. 3 mm long, 3–6 mm wide, rotund, entire. Nectary gland bilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 3.5 cm long, adnate to base of corolla tube for 5 mm, connate for 1 mm, forming an open sheath, glabrous; anthers ca. 2 mm long, ca. 3 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 5 mm long, ca. 3 mm wide, ovoid, densely pilose, style 3.5 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent when ripe, ca. 1.3 cm long, ca. 1 cm wide, ovoid when immature, pilose, loculicidally dehiscent, becoming bivalved, valves reflexed, reaching a 180° angle when mature. Seeds numerous, 0.5–1 mm long, ca. 0.2 mm wide, fusiform, longitudinally striate, dark red. Fig. 14.

Phenology. Collected in flower during January to March, May to October, and December, in fruit during January, July, and September.

Distribution (Fig. 15). Mexico (Chiapas, Oaxaca), Guatemala (Alta Verapaz, Baja Verapaz, Huehuetenango, Quiché), Honduras (Olancho, Yoro), Nicaragua (Managua, Matagalpa), and Costa Rica (San José); montane and premontane forest; 300–1800 m.

Glossoloma cucullatum is distinguished from its congeners by the cucullate (hooded) calyx lobes (Fig. 14B) with a laciniate margin. This species most closely resembles *G. tetragonum*, which has plane calyx lobes with a serrate margin. These two species are also geographically isolated; *G. tetragonum* occurs primarily in Costa Rica and reaches its

southern limit in Colombia (Fig. 39), whereas *G. cucullatum* occurs primarily in Guatemala, Honduras, and Nicaragua, and reaches its northern limit in Mexico (Fig. 15).

9. *Glossoloma grandicalyx* (J. L. Clark & L. E. Skog) J. L. Clark, Selbyana 25: 202. 2005.

Alloplectus grandicalyx J. L. Clark & L. E. Skog, Novon 12: 173. 2002.—TYPE: ECUADOR. Napo: Cantón Archidona, Reserva Ecológica Antisana, Sector Guacamayos, Sendero Jumandy-La Virgen (Km 30), path that follows potential oil pipeline, 00°38'S, 77°49'W, 1700–1800 m, 1 May 1998, *J. L. Clark, E. Narváez & T. Pauchi 5449* (holotype: QCNE!; isotypes: AAU! COL! E! MO! QCA! SRP! US!).

Herbs to subshrubs, terrestrial; stems erect, unbranched, to 1.5 m tall, 1 cm in diameter, succulent, becoming woody, internodes 3–15 cm long, quadrangular, glabrescent proximally, pilose distally, leaf scars raised from stem surface, enations at base of petiole present. Leaves opposite, equal or subequal in a pair; petioles 3–8 cm long, sparsely to densely pilose; blades 8–22 cm long, 4–10 cm wide, bullate, elliptic, base acute, apex acuminate, margin serrulate, adaxially green, glabrous, abaxially all green, all red, or green with red tinge, sparsely to densely pilose, coriaceous when dry, lateral veins 4–5 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–4 flowers per node, posture pendent at anthesis, bracteoles 15–30 mm long, 10–15 mm wide, ovate; pedicels longer than the petiole, 4–9 cm long, pilose, pedicel enations absent. Calyx lobes nearly free, each appressed to adjacent lobe, folded lengthwise with the margin curved inward, erect, 4 equal, 3–4 cm long, 2–3 cm wide, ovate, base cordate, apex obtuse, margin serrate, red, both surfaces sparsely to densely pilose; fifth (ventral) lobe smaller and narrower, to 3 cm long, to 1.5 cm wide, broadly oblong. Corolla 4.0–7.0 cm long, tubular, gibbosus basally on lower surface, spur absent, long axis of corolla slightly oblique relative to calyx; base ca. 7 mm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat not constricted, appearing laterally compressed, to 1.1 cm wide (at mouth), outside sparsely pilose at base, becoming densely pilose distally, inside mostly glabrous, with glandular trichomes at throat, interior spotting absent, limb spreading, zygomorphic, to 1.5 cm wide, bright yellow with dark red lobes, lobes nearly equal, 3–5 mm long, 3–8 mm wide, rotund, entire. Nectary gland single-lobed, bilobed, or multilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 3 cm long, adnate to base of corolla tube for ca. 3 mm, connate for 1 mm, forming an open sheath, glabrous; anthers ca. 1.5 mm long, ca. 3.5 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 6 mm long, ca. 4 mm wide, ovoid, woolly, style 4 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent when ripe, ca. 1.5 cm long, ca. 1 cm wide, ovoid when immature, woolly, loculicidally dehiscent, becoming bivalved, valves reflexed, reaching a 180° angle when mature. Seeds numerous, 0.8–1.1 mm long, 0.3 mm wide, fusiform, longitudinally striate, dark brown. Fig. 16.

Phenology. Collected in flower during January to May, July, August, November, and December, in fruit during May.

Distribution (Fig. 15). Ecuador (Carchi, Morona-Santiago, Napo, Orellana, Sucumbíos, Tungurahua, and Zamora-Chinchipe); montane forests on the eastern slopes of the Ecuadorian Andes; 1500–2500 m.

ADDITIONAL SPECIMENS EXAMINED. Ecuador. PROVINCE UNKNOWN: E of the Andes, Pearce 427 (K).—CARCHI: road Tulcán-Tufiño to Maldonado, sector la Pradera, Jaramillo 9140 (QCA).—MORONA-SANTIAGO:

Cantón Limón Indanza, “Agua Rica,” road Limón–Gualaceo, *Clark et al.* 5939 (AAU, COL, HA, K, MO, NY, QCA, QCNE, SEL, US); Cantón Limón–Indanza, Cordillera del Cónedor, trail from camp #1 to camp #2 towards crest of Cordillera del Cónedor, ca. 10–15 km SSE of Comunidad Warints, *Clark & Jost* 6956 (LOJA, MO, QCNE, SEL, UNA, US), *Clark & Jost* 6983 (QCNE, US), *Clark & Jost* 7006 (MO, QCNE, UNA, US); San Juan Bosco, road between San Juan Bosco and El Pangui, 2–3 km S of San Juan Bosco, *Clark et al.* 9894 (QCNE, UNA, US); Tumbes, 17–18 km N of Gualaquiza on road to Indanza, *Harling & Andersson* 24217 (GB, QCA, US), *Harling & Andersson* 24222 (GB, US); Cantón Limón Indanza, Cordillera de Huarcayo, E of Cordillera del Cónedor and Río Coangos, ridge E of Shuar village Tinkimints, *Jost et al.* 3019 (MO, QCNE); western slopes of Cordillera de Cutucú, trail Logroño–Yaupi, *Madison et al.* 3368 (SEL); Cantón Limón Indanza, Cordillera de Huarcayo, E of Río Cosangos, western slopes of Cerro Ijach Naint, Río Yangunts, below Cascada Tuna, *Manzanares et al.* 7269 (QCNE); Cantón Limón Indanza, Cordillera de Huarcayo, E of Cordillera del Cónedor and Río Coangos, Cerro Ijach Naint, flat-topped sandstone mountain, east of Shuar village of Tinkimints, *Neill & Manzanares* 13126 (MO, QCNE, US); Cantón Zamora, near Nambija, along road to gold mine, ca. 20 km E of Zamora, Cordillera de Nanguipa, *Neill et al.* 13816 (LOJA, MO, QCNE); Cantón Morona, Asociación Shuar Sevilla, Comunidad Angel Ruby, on Cordillera next to road Angel Ruby–Trans Cutucú, *Suin et al.* 1169 (MO, QCNE).—NAPO: Quijos, Sierra Azul, Agrícola Industrial Río Aragón, road towards San Fernando, *Alvarez & Viteri* 216 (MO, QCNE); Quijos, Sierra Azul, Agrícola Industrial Río Aragón, Campamento Aragón, Río Colorado, *Alvarez et al.* 294 (MO, QCNE); Quijos, Parroquia Baeza, comunidad Santa Lucía de Bermejo, *Alvarez et al.* 867 (MO, QCNE, US); Cantón Quijos, Parroquia de Baeza, comunidad de Santa Lucía de Bermejo, Río Bermejo, *Alvarez & Romero* 1094 (MO, QCNE, SEL, US); Cosanga, trail E of town, *Boeke & McElroy* 429 (GH, NY, SEL, US); Cantón Quijos, Cuenca del Río Cosanga, *Cerón M. et al.* 33633 (QAP), *Cerón M. et al.* 33687 (QAP); Cantón Quijos, Parroquia Cosanga, Yanayacu Biological Station and Center for Creative Studies, 5 km W of Cosanga on the road Las Cancheras, *Clark & Greeney* 5774 (QCNE, US); between Tena and Papallacta, *D'Arcy* 14089 (MO, US); road Baeza–Tena, S slope of Cordillera de Guacamayos above Jondachi, *Harling & Andersson* 19501 (GB, US); road Baeza–Tena, Km 33, Cordillera de Huacamayos, *Jørgensen et al.* 61269 (AAU); Cantón Quijos, 1.5–2 km N of Cosanga, *Kirkbride & Chamba R.* 4191 (Q, U, US); road cut, SE of El Carmelo, *Luer et al.* 6305 (SEL); road Baeza–Tena, 1–5 km SE of Cosanga, *Lutelyn & Lebrón-Lutelyn* 5669 (CAS, K, MO, NY, QCA, SEL, US); Baeza, *Maas et al.* 3019 (QCA, U); Cantón El Chaco, Proyecto Hidroeléctrico Coca, Punto ST3, Río Quijos, ca. 10 km S of Reventador, *Palacios* 5931 (MO, QCNE, US); Cantón El Chaco, sitio Tres Cruces, towards El Mirador, *Palacios* 6896 (MO, QCNE, US); Cuyuja, along banks of Río Quijos, SW of Quito–Baeza road, *Sobel & Strudwick* 2520 (NY); ridge above Río San Juan Grande, ca. 9.5 km NW of El Chaco, *Ståhl et al.* 2199 (QCA); southern slopes of Cordillera de Guacamayos, ca. 5 km below pass, *Stein* 2647 (MO, US); road Papallacta–Baeza, upper part of “Y,” *Valencia et al.* 2880 (AAU, F); Cantón Tena, Parque Nacional Llanganates, mountains NW of Río Mulatos, Río Sápala, *Vargas et al.* 2455 (MO, QCNE, US); Quijos, Reserva Ecológica Antisana, Cordillera de los Guacamayos, between El Mirador and La Virgen, Arco pipeline, *Vargas & Narváez* 3181 (US); Quijos, Reserva Ecológica Antisana, Cordillera de los Guacamayos, sector Oriental, Arco pipeline, between El Mirador and La Virgen, *Vargas & Narváez* 3576 (MO, QCNE, US).—ORELLANA: Cantón Archidona, Sumaco Napo–Galeras National Park, Volcán Sumaco, between small crater lake and Pacto Sumaco, *Clark* 2282 (QCNE, SEL, US).—SUCUMBÍOS: Cantón Bonita, Cerro El Ortigo, *Cerón M. et al.* 38703 (QAP); Reserva Ecológica Cayambe Coca, Volcán Reventador, trail Río Quijos–Refugio, *Clark* 4448 (QCNE, US); Campo de Sebundoy, *Dalström* 1675 (SEL).—TUNGURAHUA: Cantón Baños, Parroquia Río Verde, Sector Machay, forested trail from Baños–Puyo road towards Cascada de San Miguel via San Agustín, *Clark et al.* 5719 (K, QCNE, SEL, US); hacienda San Antonio, 4 km up Río Ulba canyon from Ulba, 2 km E of Baños, *Stein* 2929 (AAU, MO, NY, QCNE, US); Cantón Baños, Los Llanganates, Colonia México, 18 km from El Topo, *Vargas & Sandoval* 380 (MO, QCNE, US).—ZAMORA–CHINCHIPE: W of Zamora, *Hart* 1172 (A); Romerillo, trail at limit of Parque Nacional Podocarpus, *Madsen & Knudsen* 86839 (AAU, LOJA, QCA, QCNE); Zamora–Saravandal, *Poortmann* 383 (P).

Glossoloma grandicalyx is distinguished from *G. tetragonoides* and other members of the genus by the combination of broadly ovate calyx lobes (Fig. 16B), corollas with the tube bright yellow and the lobes dark maroon (Fig. 16C), an erect unbranched primary shoot (Fig. 16A), and pilose indumentum on the leaves, calyx lobes, and stems. On further study, some of the paratypes that were listed for *G. grandicalyx* in the protologue (Clark & Skog 2002) have been found to represent *G. oblongicalyx* (e.g., *J. Cuatrecasas* 8553, *Londoño & Kvist* 99, *Stein* 3730, *Ewan* 16693, *Gentry & Shupp* 26626). The two species are readily separated geographically and morphologically. *Glossoloma oblongicalyx* is

restricted to the Chocó floristic region of southwestern Colombia and northwestern Ecuador and the eastern cordillera of Colombia (Fig. 23), and thus not sympatric with *G. grandicalyx*. *Glossoloma grandicalyx* differs from *G. oblongicalyx* in the following characters: pedicels longer than the petioles (Fig. 16B), and calyx lobes that cover two-thirds of the corolla tube (Fig. 16C) and are sparsely to densely pilose. Some characters that are difficult to see on herbarium collections but apparent in the field include the bright yellow corolla tubes with dark red lobes and the tendency for the leaf blades to be bullate adaxially. Most other similar species of *Glossoloma* will have a lighter red or yellow corolla and non-bullate leaves (e.g., many populations of *G. tetragonoides* from the Napo and Tungurahua provinces of Ecuador). Most species of *Glossoloma* have a single or two-lobed nectary gland, whereas *G. grandicalyx* sometimes has a multi-lobed nectary gland.

Glossoloma grandicalyx is sympatric with *G. tetragonoides* along the eastern Andes of Ecuador, although the latter is more abundant at lower elevations and the former is more abundant at higher elevations.

10. *Glossoloma harlequinoides* J. L. Clark, sp. nov.—TYPE: ECUADOR. Esmeraldas: Cantón San Lorenzo, Parroq. Alto Tambo, small patch of forest along San Lorenzo–Ibarra hwy, 37 road-km NW of Lita, 25 air(direct)-km NW of Lita, 450 m, 26 Mar 2003, J. L. Clark, R. Hall & F. Nicolalde 7562 (holotype: QCNE!; isotypes: AAU! BM! CAS! COL! E! F! K! MO! NY! QCA! SEL! UNA! US!).

G. panamensi simile sed corollis bicoloribus differt.

Subshrubs, usually terrestrial, rarely epiphytic; stems erect, unbranched, to 2 m tall, to 1 cm in diameter, woody, internodes 3–10 cm long, subquadrangular, glabrescent proximally, sparingly pilose distally, leaf scars slightly raised from the stem surface, enations at base of petiole present. Leaves opposite, equal in a pair; petioles 2–9 cm long, glabrous; blades 10–27 cm long, 5–10 cm wide, elliptic to oblong, base acute, apex acute to acuminate, margin serrate, adaxially green, sparingly sericeous, abaxially uniformly green to green with red tinge, tomentose, coriaceous when dry, lateral veins 6–8 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–4 flowers per node, posture pendent at anthesis, bracteoles 10 mm long, 5 mm wide, broadly ovate; pedicels shorter than the petiole, 1.5–3.0 cm long, densely pilose, pedicel enations present. Calyx lobes nearly free, each appressed to adjacent lobe, folded lengthwise with the margin curved inward, erect, nearly equal, 2.5 cm long, 1.5 cm wide, broadly ovate, base truncate, apex rounded, margin laciniate to serrate, green or red, abaxially densely pilose, adaxially sparingly pilose to densely pilose near middle. Corolla 5 cm long, tubular, gibbosus basally on lower surface, spur absent, long axis of corolla slightly oblique relative to calyx; base 5–8 mm in diameter, middle slightly ampliate to uniformly tubular, throat not constricted, appearing laterally compressed, 7–9 mm wide (at mouth), outside densely pilose, inside mostly glabrous, with glandular trichomes at throat, interior spotting absent, limb reflexed, zygomorphic, to 9 mm wide, red alternating with white splotches, lobes nearly equal, 5 mm long, 8 mm wide, rotund, entire. Nectary gland bilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 2.7 cm long, adnate to base of corolla tube for ca. 2 mm, connate for 4 mm, forming an open sheath, glabrous; anthers ca. 1.5 mm long, ca. 2 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary 6 mm long, 4 mm wide, ovoid, pilose, style 2.5 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent when ripe, ca. 1.7 cm long, ca. 1.5 cm wide, ovoid when immature, pilose, loculicidally dehiscent, becoming bivalved, valves reflexed,

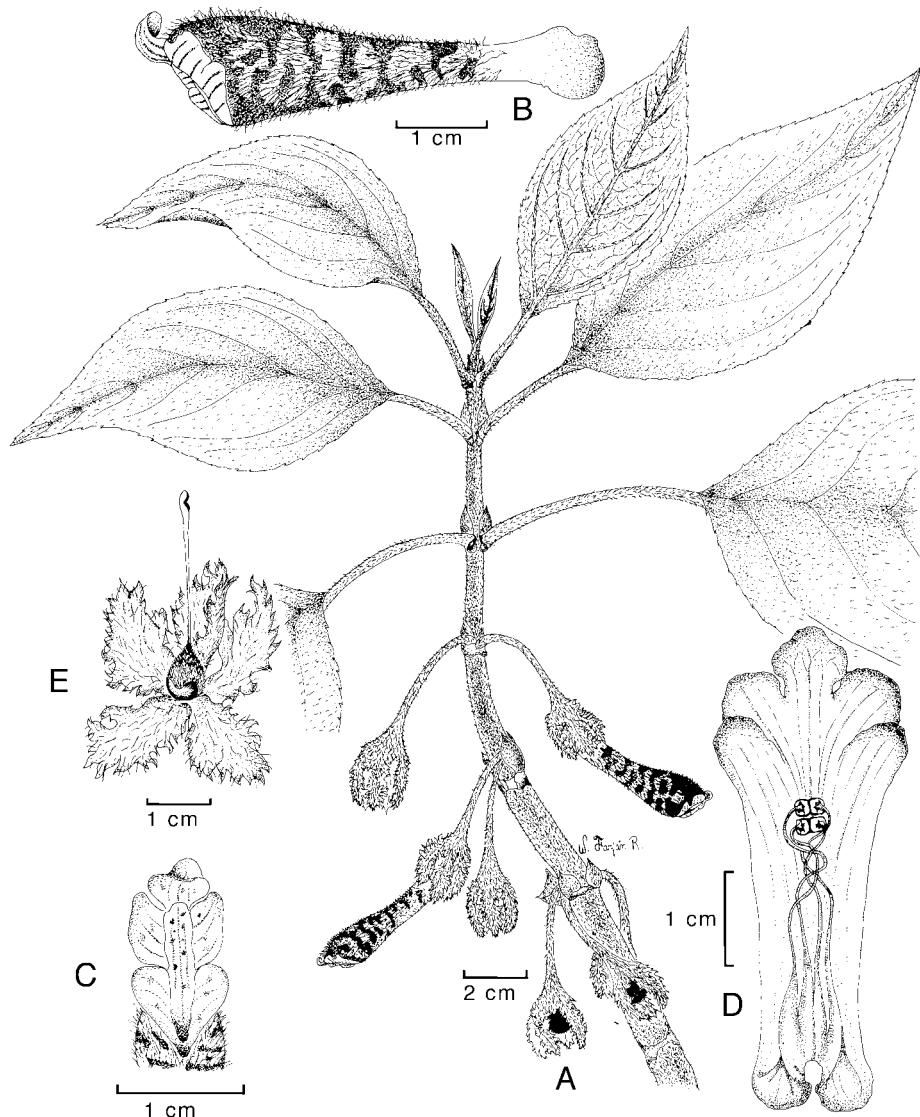

FIG. 17. *Glossoloma harlequinoides*. A. Habit. B. Side view of corolla. C. Face view of flower. D. Corolla opened to show stamens. E. Calyx opened and corolla removed to show pistil and bilobed nectary gland. (Based on: A–D, J. L. Clark 7157; E, J. L. Clark et al. 7472.)

reaching a 180° angle when mature. Seeds numerous, 1 mm long, 0.4 mm wide, ellipsoid, longitudinally striate, light brown. Fig. 17.

Phenology. Collected in flower from January through September, in fruit during February, March, July, September, and November.

Distribution (Fig. 15). Colombia (Nariño, Valle del Cauca) and Ecuador (Carchi, Esmeraldas); montane and premontane forests of western Andean slopes; 200–1800 m.

ADDITIONAL SPECIMENS EXAMINED. **Colombia.** NARIÑO: Mpio. Tumaco, 80 km from Tumaco on road to Pasto, *Balick et al.* 1663 (US); Mpio. Glossoloma harlequinoides is distinguished from all other species of *Glossoloma* by the irregular colored patches on the corolla tube (Fig. 17B). Some members of the genus have corolla lobes that contrast in color with the corolla tube (e.g., uniformly yellow tube with red lobes, as in *G. grandicalyx* and *G. tetragonoides*), but *G. harlequinoides* is the only species to have a corolla tube with a patchy color pattern. The corolla tube of *G. harlequinoides* has a color pattern of red alternating with white that gives it a painted-like appearance to which the epithet refers (i.e., fancifully varied in color).

11. ***Glossoloma herthae* (Mansfeld) J. L. Clark, Selbyana 25: 202. 2005. *Alloplectus herthae* Mansfeld, Notizbl. Bot. Gart. Berlin-Dahlem 14: 38. 1938.—TYPE: ECUADOR. Pichincha. “San Carlos” [= San Carlos de los Colorados], 120 m, 8 Sep 1935, *H. Schultze-Rhonhof* 1903 (holotype: B, destroyed).—ECUADOR. Pichincha: along old road between Santo Domingo–Quito (via Chiriboga), 1400–1600 m, 28 Oct 1995, *P. Mendoza-T. et al.* 618 (neotype, designated by Clark, 2005: QCNE!; isoneotypes: AAU! CAS! COL! E! F! GB! MO! NY! QCA! SRP! US!).
Besleria horizontalis C. V. Morton, Contr. U.S. Natl. Herb. 38(4): 145. 1968.—TYPE: PERU. Cuzco: Convención, alturas de Pintobamba, 2700 m, 4 Mar 1943, *C. Vargas C.* 3252 (holotype: US!; isotype: US!).**

Herbs to subshrubs, epiphytic; stems horizontal, sparingly branched, to 2 m tall, 3–8 mm in diameter, subwoody, internodes 2–5 cm long, subquadrangular, glabrescent proximally, sericeous distally, leaf scars slightly raised from the stem surface, enations at base of petiole present. Leaves opposite, equal or subequal in a pair; petioles 1–3 cm long, sericeous; blades 8–15 cm long, 2.5–4.5 cm wide, elliptic, base acute, usually oblique, apex acuminate, margin serrulate, adaxially dark green, glabrous, abaxially usually reddish with green veins, sometimes uniformly green, puberulous, subcoriaceous when dry, lateral veins 6–8 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–5 flowers per node, posture pendent at anthesis, bracteoles 10 mm long, 5 mm wide, linear; pedicels shorter than the petiole, 1–2.5 cm long, sparingly sericeous, pedicel enations present. Calyx lobes imbricate, nearly free, plane, erect, nearly equal, 5–15 mm long, 4–7 mm wide, rotund, base truncate, apex obtuse, margin entire, yellow or reddish orange, abaxially sparsely sericeous, adaxially glabrous. Corolla 3.0–5.5 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla perpendicular relative to calyx; base ca. 5 mm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat slightly constricted, appearing laterally compressed, to 5–10 mm wide (at mouth), outside glabrous or pilose, inside glabrous, red spotting sometimes present on the upper surface of throat, limb reflexed, zygomorphic, to 1.1 cm wide, usually yellow, sometimes reddish orange, lobes nearly equal, ca. 2 mm long, ca. 3 mm wide, rotund, entire. Nectary gland single-lobed, on ventral surface of ovary, glabrous. Filaments twisted after anthesis, free portion 1.5–2.0 cm long, adnate to base of corolla tube for ca. 2 mm, connate for 1 m, forming an open sheath, glabrous; anthers ca. 1.5 mm long, ca. 2 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary to 4 mm long, to 3 mm wide, ovoid, pilose, style ca. 3 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent when ripe, ca. 1.5 cm long, ca. 1 cm wide, ovoid when immature, pilose, loculicidally dehiscent, becoming bivalved, valves not reflexed, reaching a 45° angle when mature. Seeds numerous, ca. 1 mm long, ca. 0.5 mm wide, fusiform, longitudinally striate, dark red. Fig. 18.

Phenology. Collected in flower throughout the year, in fruit during January, March to May, July, and November.

Distribution (Fig. 19). Colombia (Antioquia, Cauca, Cundinamarca, Huila, Nariño, Norte de Santander, Putumayo, Tolima, Valle del Cauca); Ecuador (Carchi, Chimborazo, Cotopaxi, Imbabura, Loja, Pichincha, Zamora-Chinchipe); and Peru (Cajamarca and Cuzco); premontane and montane forests; 200–2800 m.

Glossoloma herthae closely resembles *G. bolivianum* and *G. pycnosuzygium*, but differs in its elliptic leaves, which are occasionally falcate. Other characters that are useful for distinguishing *G. herthae* are the epiphytic habit with non-scandent horizontal stems and imbricate calyx lobes (Fig. 18B) with an entire margin. See *G. bolivianum* (no. 5) and *G. pycnosuzygium* (no. 20) for further discussion.

Glossoloma herthae is most commonly collected on the western Andean slopes of northern Ecuador and southern Colombia; its range extends to the eastern Andean slopes of southern Peru and the western Andean slopes of Colombia.

Herbs to subshrubs, terrestrial; stems erect, usually unbranched, to 2 m tall, to 1.5 cm in diameter, woody, succulent when young, internodes 2–10 cm long, quadrangular, glabrescent proximally, densely woolly distally, epidermis peeling off in scales, leaf scars raised from stem surface, enations at base of petiole present. Leaves opposite, equal or subequal in a pair; petioles 2–4 cm long, sparsely to densely woolly; blades 7–22 cm long, 3–12 cm wide, elliptic to oblong to obovate, base cuneate to acute, occasionally oblique, apex acute to acuminate, margin denticulate to serrate, adaxially green, strigose, abaxially much lighter green or rarely reddish, strigose, coriaceous when dry, lateral veins 6–8 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 5–15 flowers per node, posture pendent at anthesis, bracteoles 30 mm long, 15 mm wide, oblong; pedicels shorter than the petiole, 0.5–2.0 cm long, pilose, pedicel enations present. Calyx lobes nearly free, each appressed to adjacent lobe, folded lengthwise with the margin curved inward, erect, 4 subequal, 15–20 mm long, 6–15 mm wide, broadly ovate, base truncate, apex obtuse to acuminate, margin serrate to laciniate, red, green, or green with red margins, abaxially densely sericeous, especially towards the midvein, adaxially sparsely sericeous; fifth (ventral) lobe smaller and narrower, to 2 cm long, to 1.4 cm wide, broadly oblong. Corolla 2.5–3.2 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla oblique relative to calyx; base ca. 7 mm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat constricted, not appearing laterally compressed, ca. 5 mm wide (at mouth), outside densely sericeous, inside sparsely sericeous, with glandular trichomes at throat, interior spotting absent, limb spreading, sub-regular, ca. 8 mm wide, uniformly yellow or uniformly red, rarely yellow with patch of red on dorsal surface, often red with patch of yellow on dorsal surface, lobes nearly equal, ca. 1.5 mm long, ca. 2 mm wide, rotund, spreading, entire. Nectary gland bilobed, on ventral surface of ovary, glabrous. Filaments curved after anthesis, free portion to 1.5 cm long, adnate to base of corolla tube for ca. 4 mm, connate for 2 mm, forming an open sheath, glabrous; anthers 1.5 mm long, 2 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 6 mm long, ca. 4 mm wide, ovoid, densely tomentose, style 1–1.5 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent when ripe, 1.4 cm long, 1.0 cm wide, globose to ovoid when immature, pilose, loculicidally dehiscent, becoming bivalved, valves not reflexed, reaching a 45° angle when mature. Seeds numerous, ca. 1 mm long, ca. 0.2 mm wide, ellipsoid, longitudinally striate, yellow. Fig. 20.

Phenology. Collected in flower and fruit throughout the year.

Distribution (Fig. 19). Widespread and commonly collected in western Panama (Chiriquí, Bocas del Toro), Costa Rica, Colombia, and Ecuador (> 500 collections data-based); less commonly collected in Peru (Amazonas, Cajamarca, Cuzco, Huánuco, Junín, Loreto, Pasco, Puno, San Martín) and Venezuela (Anzoátegui, Barinas, Mérida, Monagas,

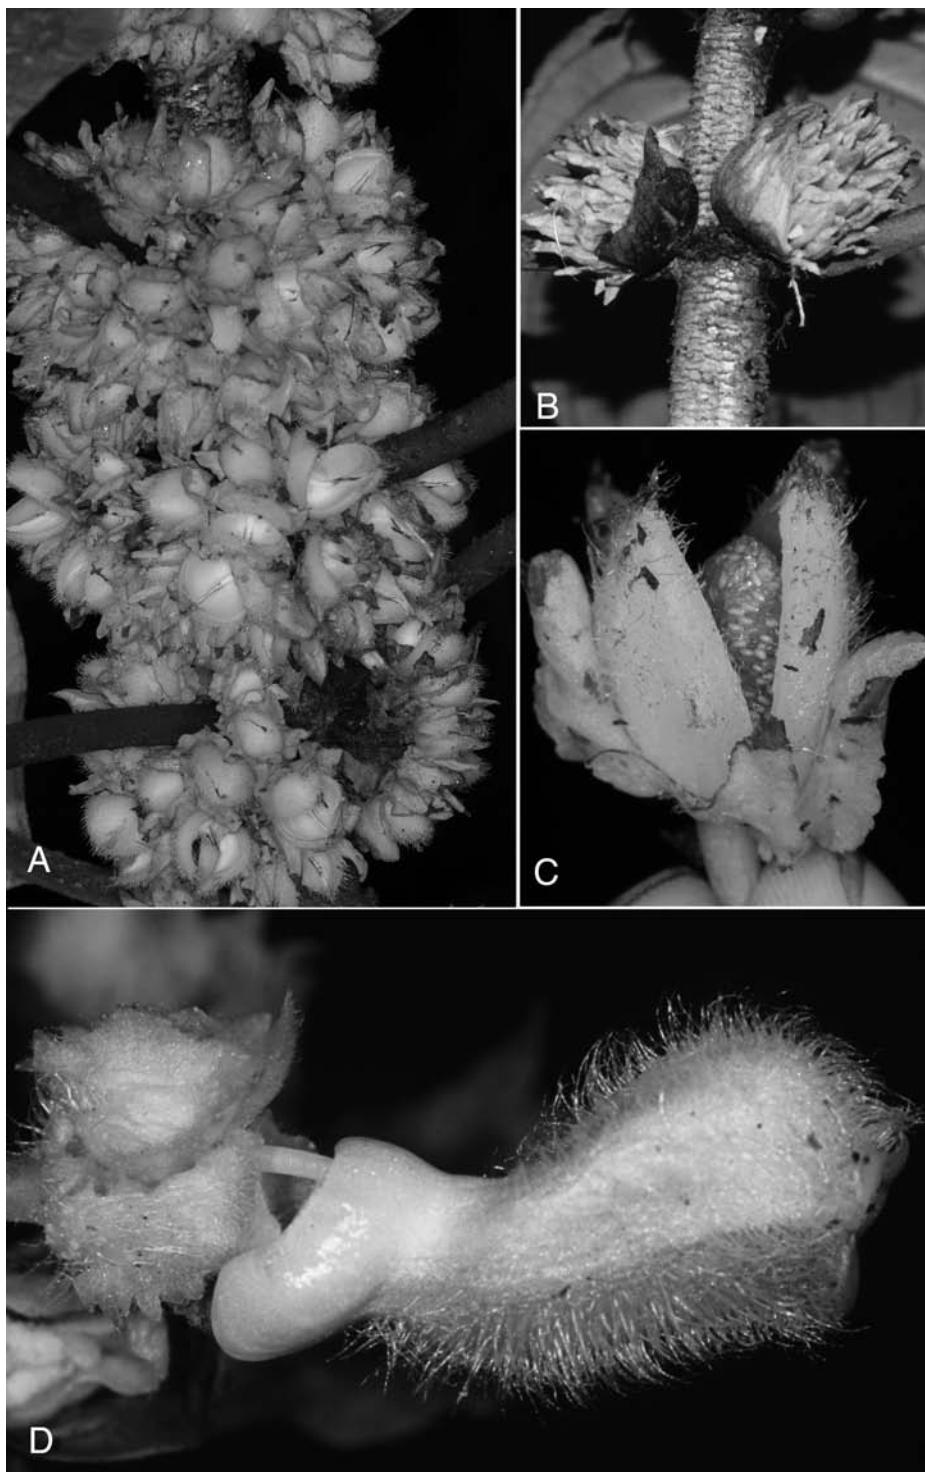

FIG. 20. *Glossoloma ichthyoderma*. A. Stem showing axillary fascicles of fruits. B. Stems showing exfoliating scale-like epidermis and bracteoles subtending axillary fascicles of flowers. C. Glossoloma ichthyoderma is distinguished from other members of the genus by an exfoliating scale-like epidermis (Fig. 20B), uniformly round throat, and apically constricted corolla tube (Fig. 20D). The exfoliating epidermis in *G. ichthyoderma* is a unique feature for the genus, and it is found in only a few other species in Episcieae (e.g., *Columnea spathulata* Mansf.). The specific epithet is derived from this unique feature because of the resemblance of the stem's surface to fish scales. On rare occasions the exfoliating epidermis is absent, and the stem surface is glabrescent to densely woolly. The corolla throat of *G. ichthyoderma* is uniformly round in contrast to the more common laterally compressed

(Fig. 4B) shape found in other species. Uniformly round throats are found only in three other species: *G. anomalum*, *G. bicolor*, and *G. martinianum*. The corolla of *G. ichthyoderma* is apically constricted, which gives the pouch the appearance of being medial on the corolla tube (Fig. 20D). Non-constricted corollas result in the pouch appearing more terminal, as in *G. grandicalyx* (Fig. 16C). The corolla tube is usually dorsally yellow and ventrally red (Fig. 20D), but coloration is variable. Photographs of recent collections have documented corolla tube colors that range from uniformly yellow to uniformly red to red with yellow patches on the ventral surface. Most members of *Glossoloma* have uniformly colored corollas, except for *G. bicolor*, *G. harlequinoides* (Fig. 17B), and *G. grandicalyx* (Fig. 16C).

In the protologue for *Alloplectus meridensis* (Hanstein 1865), the type collection is given as "Moritz 1032," a typographical error for Moritz 1132. The lectotype (G) and isotypes (BM, BR, P) are labeled with the field collection number "1132."

13. *Glossoloma martinianum* (J. F. Smith) J. L. Clark, Selbyana 25: 203. 2005. *Alloplectus martinianus* J. F. Smith, Novon 9: 4191. 1999.—TYPE: ECUADOR. Napo: road from Baeza to Tena, 5 km S of Baeza, 26 Jun 1983, J. Bohlin & M. Bohlin 698 (holotype: US!; isotype: GB).

Subshrubs, usually epiphytic, sometimes terrestrial; stems erect, sparingly branched, 1.5 m long, 5–10 mm in diameter, woody, internodes 2–5 cm long, terete, densely villous, leaf scars raised from stem surface, enations at base of petiole present. Leaves opposite, equal or subequal in a pair; petioles 0.5–2.0 cm long, densely villous; blades 5–14 cm long, 1–3.3 cm wide, narrowly lanceolate, base cuneate, apex acute, margin serrate, adaxially dark green, densely tomentose, abaxially usually dark purple, sometimes dark green with purple veins, densely tomentose, coriaceous when dry, lateral veins 5–7 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 2–5 flowers per node, posture horizontal at anthesis, bracteoles ca. 3 mm long, 1–1.3 mm wide, lanceolate; pedicels shorter than the petiole, 0.5–1.0 cm long, densely tomentose, pedicel enations absent. Calyx lobes nearly free, plane, usually completely separate, sometimes slightly valvate, erect, nearly equal, 8–17 mm long, 2–5 mm wide, broadly elliptic, base truncate, apex acute, margin entire to serrulate, light green, both surfaces densely tomentose; fifth (ventral) lobe smaller and narrower, to 2.5 cm long, 0.3 cm wide, broadly ovate to lanceolate. Corolla 1.4–2.0 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla slightly oblique relative to calyx; base ca. 5 mm, middle ampliate, becoming apically ventricose on upper surface, throat slightly constricted, appearing laterally compressed, ca. 9 mm wide (at mouth), outside densely tomentose, inside glabrous, red spotting present on the upper surface of throat, limb spreading, subregular, ca. 9 mm wide, yellow, lobes nearly equal, rotund, spreading, ca. 1 mm long, ca. 1.5 mm wide, entire. Nectary gland bilobed, on ventral surface of ovary, glabrous. Filaments curved after anthesis, free portion to 1.5 cm long, adnate to base of corolla tube for ca. 2 mm, connate for 3 mm, forming an open sheath, glabrous; anthers ca. 2 mm long, ca. 2 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 3 mm long, ca. 2 mm wide, ovoid, tomentose, style 1 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent when ripe, 6–10 mm long and wide, globose when immature, villous, loculicidally dehiscent, becoming bivalved, valves not reflexed, reaching a 45° angle when mature. Seeds numerous, ca. 0.8 mm long, ca. 0.2 mm wide, fusiform, longitudinally striate, reddish brown to black.

Fig. 21.

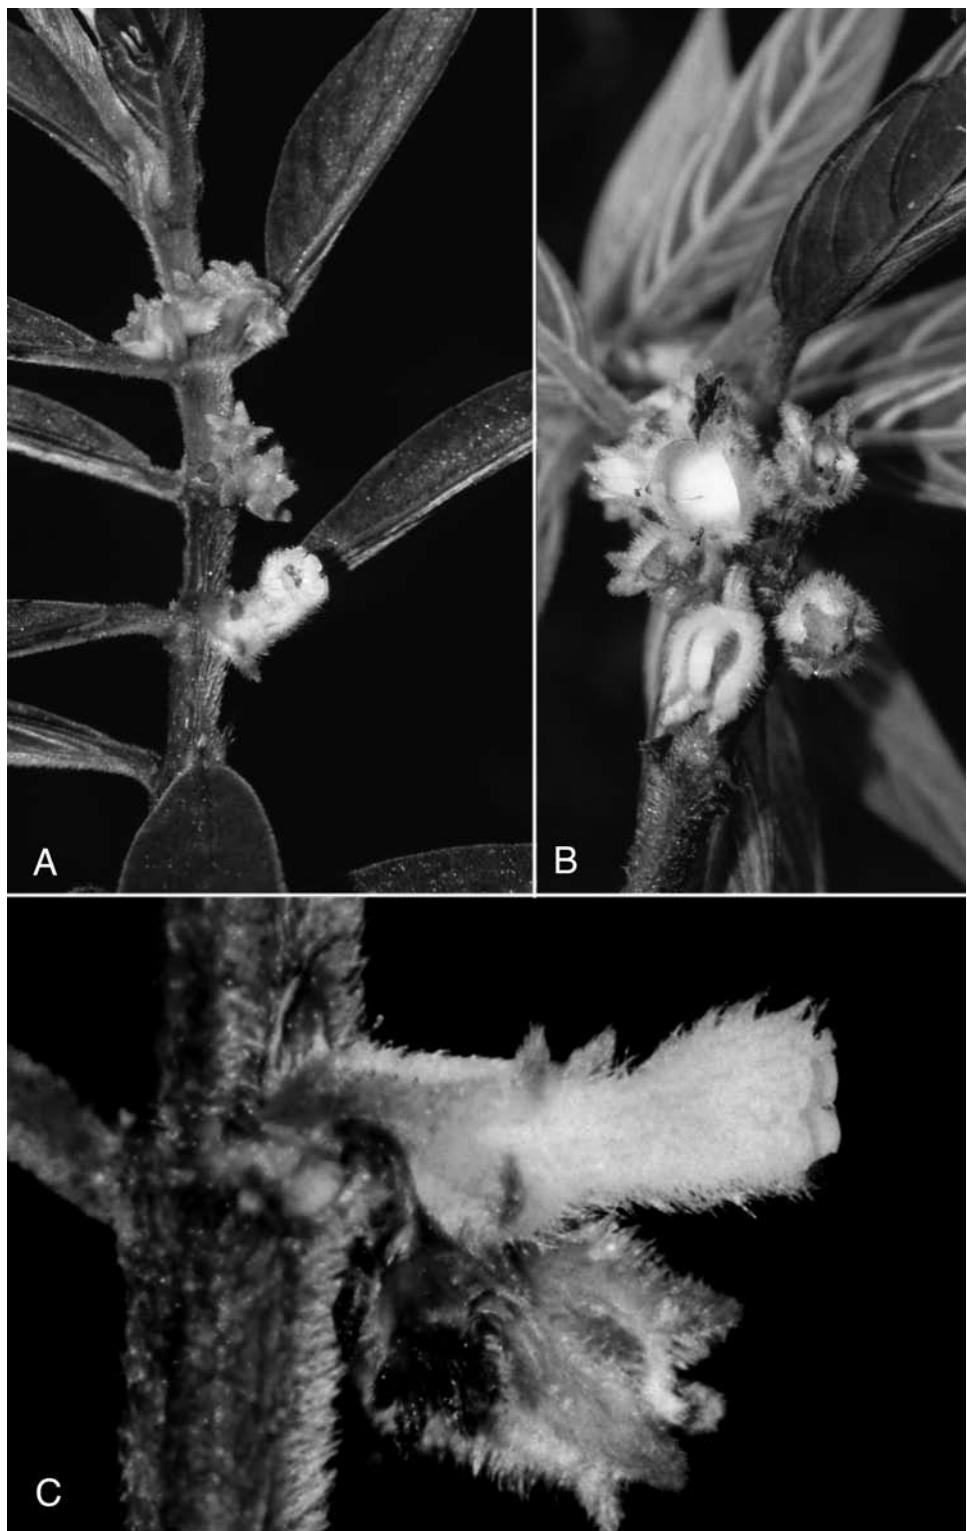

FIG. 21. *Glossoloma martinianum*. A. Habit. B. Mature fruits. C. Lateral view of flower. (Photos by J. L. Clark; voucher: J. L. Clark & V. Durán 6043.)

Phenology. Collected in flower throughout the year, in fruit during March to May and August to November.

Distribution (Fig. 19). Eastern slopes of the Ecuadorian Andes (Sucumbíos, Napo, Morona-Santiago, Zamora-Chinchipe, and Tungurahua) and the northeastern slopes of the Peruvian Andes (Amazonas, Cajamarca, and San Martín); in wet montane forests; 1200–2500 m.

Ríoja; 100 km from Ríoja on road to Pomacocha (Florida), Km 384, Stein & Todzia 2191 (US, USM).

Glossoloma martinianum is distinguished from other members of the genus by narrowly lanceolate leaves with dense tomentose pubescence, densely villous short corollas, fruit dehiscence angle, and an occasional reticulate epidermal pattern on the adaxial leaf surface. The bivalved fruits open at a 45° angle (Fig. 21B) compared to the fully reflexed dehiscent capsules present in most other congeners. Many early collections of *G. martinianum* were annotated as belonging to the superficially similar *Columnea formosa* (C. V. Morton) C. V. Morton from which it differs by having longer pedicels and a capsule instead of an indehiscent berry. The presence of a berry is one of the few unambiguous morphological synapomorphies for the genus *Columnea*, and until a mature fruit was observed the generic placement of this species was dubious (Smith 1999).

14. *Glossoloma medusaeum* (L. E. Skog) J. L. Clark, Selbyana 25: 203. 2005. *Alloplectus medusaeus* L. E. Skog, Ann. Missouri Bot. Gard. 65: 797. 1979.—TYPE: PANAMA. Chiriquí: slopes of La Popa, above Boquete, 1600 m, 5 Aug 1972, W. G. D'Arcy & J. J. D'Arcy 6398 (holotype: US!; isotypes: MO-2 sheets! SEL!).

Herbs to subshrubs, usually terrestrial, sometimes epiphytic; stems usually erect, sometimes scandent, unbranched, to 2 m tall, to 1 cm in diameter, usually woody, herbaceous when young, internodes 2–5 cm long, subquadrangular, glabrescent proximally, densely strigillose distally, leaf scars raised from stem surface, enations at base of petiole present. Leaves opposite, equal or subequal in a pair; petioles 3.0–10.5 cm long,

strigillose; blades 20–28 cm long, 6–11 cm wide, elongate-elliptic or narrowly obovate, base cuneate, apex acuminate, margin serrate, adaxially green, sparsely strigillose, abaxially pink to dark red, strigillose, membranous when dry, lateral veins 6–8 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–6 flowers per node, posture horizontal at anthesis, bracteoles ca. 10 mm long, ca. 5 mm wide, elliptic; pedicels shorter than the petiole, 0.7–3.0 cm long, strigillose, pedicel enations present. Calyx lobes nearly free, each appressed to adjacent lobe, folded lengthwise with the margin curved inward, erect, 4 subequal, 10–25 mm long, 6–10 mm wide, lanceolate to ovate, base truncate, apex acute, margin fimbriate, the teeth to 5 mm long, green to yellow or reddish, abaxially strigillose to pilose, adaxially strigose to densely pilose (especially at base). Corolla 2.5–3.5 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla oblique relative to calyx; base ca. 5 mm, middle ampliate, becoming apically ventricose on upper surface, throat slightly constricted, appearing laterally compressed, 6–8 mm wide (at mouth), outside densely pilose, inside mostly glabrous, with glandular trichomes at throat, red spotting sometimes present on the upper surface of throat, limb spreading, zygomorphic, ca. 9 mm wide, pale yellow to red, lobes nearly equal, ca. 2 mm long, ca. 2 mm wide, rotund, spreading, entire. Nectary gland bilobed or single-lobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 2 cm long, adnate to base of corolla tube for ca. 3 mm, connate for 1 mm, forming an open sheath, glabrous; anthers ca. 1 mm long, ca. 2 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 6 mm long, ca. 5 mm wide, subglobose, densely pilose, style ca. 1.5 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent when ripe, globose when immature, ca. 1.2 cm long, ca. 1.0 cm wide, densely pilose, loculicidally dehiscent, becoming bivalved, valves not reflexed, reaching a 45° angle when mature. Seeds numerous, ca. 1 mm long, ca. 0.3 mm wide, fusiform, longitudinally striate, yellow. Fig. 22.

Phenology. Collected in flower during January to August and October to December, in fruit during January, February, April, June, July, August, October, November, and December.

Distribution (Fig. 23). Central America (Costa Rica, Panama) and the eastern and western slopes of the northern Andes of South America (Colombia, Ecuador, northern Peru); in montane forests; 300–2000 m.

Rioja; Pardo Miguel, Centro Poblado Aguas Verdes, Camp 1, *Sánchez Vega et al.* 9476 (F).

Glossoloma medusaeum is one of four terrestrial subshrub species with fimbriate calyx margins (Fig. 22D). It differs from the other three (*G. purpureum*, *G. anomalum*, *G. sprucei*) in its glabrescent leaves, stems, and calyx lobes. The stems and calyces of *G. sprucei* are densely villous (Fig. 35C); the calyx lobes are broadly ovate and more deeply fimbriate (Fig. 35). In South America, where *G. medusaeum* and *G. sprucei* are sympatric, the two species can be differentiated by flower color. The corolla of *G. sprucei* is yellow and that of *G. medusaeum* red; however, populations of *G. medusaeum* in Central America

have corollas that are uniformly yellow. *Glossoloma anomalum* is distinguished from *G. medusaeum* by smaller corollas (ca. 1.5 cm long) and non-resupinate flowers (Fig. 8). *Glossoloma purpureum* is easily differentiated from all other congeners by the abaxial uniformly bright purple leaf coloration.

15. *Glossoloma oblongicalyx* (J. L. Clark & L. E. Skog) J. L. Clark, Selbyana 25: 204. 2005. *Alloplectus oblongicalyx* J. L. Clark & L. E. Skog, Novon 15: 74. 2005.—TYPE: ECUADOR. Pichincha: Cantón Quito, trail between Lloa and Mindo, 30 km W of Lloa, 00°11'S, 78°41'W, 1800 m, 12 Feb 1997, J. L. Clark & C. S. Clark 3903 (holotype: QCNE!; isotypes: AAU! MO! NY! US!).

Herbs to subshrubs, terrestrial; stems erect, unbranched, to 3 m tall, to 1 cm in diameter, usually woody, succulent when young, internodes 5–10 cm long, terete to quadrangular, glabrescent or glabrous, sometimes sparsely pubescent, leaf scars raised from stem surface, enations at base of petiole present. Leaves opposite, usually equal in a pair; petioles 5–12 cm long, sparsely to densely pilose; blades 12–22 cm long, 8–15 cm wide, elliptic, base acute to rounded, apex acute to obtuse, margin serrate or serrulate, adaxially green, sparsely strigose, abaxially all green to all red, sparsely to densely pilose, coriaceous when dry, lateral veins 5–8 per side. Inflorescence not pedunculate, flowers appearing fasciculate, with 3–5 resupinate flowers per node, posture pendent at anthesis, bracteoles ca. 20 mm long, 8 mm wide, ovate; pedicels shorter than the petiole, 3–5 cm long, pilose, pedicel enations present. Calyx lobes nearly free, each appressed to adjacent lobe, folded lengthwise with the margin curved inward, erect, 4 equal, 4–5 cm long, 2–3 cm wide, oblong, base cordate, apex obtuse, margin serrulate or entire, all green, all red, or mostly red with greenish white base, both surfaces sparsely pilose; fifth (ventral) lobe smaller and narrower, 3–4 cm long, 0.5–1 cm wide, oblong. Corolla 5–6.5 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla oblique relative to calyx; base 0.5–1 cm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat not constricted, appearing laterally compressed, 13 mm wide (at mouth), usually uniformly dark red, sometimes appearing orange to vermillion, outside sparsely sericeous becoming densely sericeous distally, inside mostly glabrous, with glandular trichomes at throat, interior spotting absent, limb reflexed, zygomorphic, to 1.5 cm wide, usually dark red, sometimes appearing orange to vermillion, lobes nearly equal, 4–5 mm long, 4.5 mm wide, rotund, spreading, slightly recurved, entire. Nectary gland bilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 2.5 cm long, adnate to base of corolla tube for ca. 4 mm, connate for 1 mm, forming an open sheath, glabrous; anthers ca. 1 mm long, ca. 3 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 5 mm long, ca. 4 mm wide, ovoid, densely pilose, style 3–4 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent when ripe, ca. 2 cm long, ca. 1.3 cm wide, ovoid when immature, pilose, loculicidally dehiscent, becoming bivalved. Seeds numerous, 0.9 mm long, 0.3 mm wide, fusiform, longitudinally striate, brownish red. Fig. 24.

Phenology. Flowering and fruiting throughout the year.

Distribution (Fig. 23). Ecuador and southern Colombia; 1400—3200 m.

Glossoloma oblongicalyx is distinguished from other members of the genus by the combination of uniformly colored corollas, an erect unbranched habit, conspicuously oblong calyx lobes, and pedicels that are shorter than the petioles. *Glossoloma oblongicalyx* resembles *G. grandicalyx*; some of the paratypes cited for *G. grandicalyx* (see that species, no. 9) are here assigned to *G. oblongicalyx* (Clark et al. 2005). The oblong calyx lobes and shorter pedicels of *G. oblongicalyx* (Fig. 24) are the most consistent characters for separating it from *G. grandicalyx*. The color of the calyx lobes in *G. oblongicalyx* is variable and ranges from greenish white to uniformly red. The color of the leaves also varies from green to red. Many herbarium collections of *G. oblongicalyx* were originally determined as *G. tetragonoides* or *G. tetragonum*. *Glossoloma oblongicalyx* differs in having larger and oblong calyx lobes in contrast to smaller and more ovate calyx lobes of *G. tetragonoides*. The calyx lobe margin of *G. oblongicalyx* is serrulate or entire in contrast to the deeply serrate margins of *G. tetragonum*. The geographic ranges of these two species overlap in Colombia, but *G. tetragonum* is more common in Central America (Fig. 39) and *G. oblongicalyx* is more common in Ecuador and eastern Colombia (Fig. 23). *Glossoloma oblongicalyx* has been collected in the northwestern Andean slopes of Ecuador and southern Colombia from 1400 to 3200 m. Although recorded from the eastern Andean slopes in Colombia (Cordillera Oriental), it has not yet been found on the adjacent eastern slopes in Ecuador.

16. *Glossoloma panamense* (C. V. Morton) J. L. Clark, Selbyana 25: 204. 2005. *Alloplectus panamensis* C. V. Morton, Ann. Missouri Bot. Gard. 29: 36. 1942.—TYPE: PANAMA. Coclé: hills N of El Valle de Antón, 1000 m, 14 Jul 1940, P. H. Allen 2189 (holotype: US!; isotypes: MO! S!).

Herbs to subshrubs terrestrial, rarely epiphytic; stems erect, unbranched, to 2.5 m tall, to 2.0 cm in diameter, woody, internodes 5–11 cm long, subquadrangular, glabrescent

proximally, densely yellow-hirsute distally, leaf scars raised from stem surface, enations at base of petiole present. Leaves opposite, usually equal in a pair; petioles 8–15 cm long, hirsute; blades chartaceous when dry, ovate to elliptic-ovate, 10.5–37.0 cm long, 6.2–20 cm wide, base acute to rounded or truncate, apex acuminate to acute, margin serrate or serrulate, adaxially dark green to dull reddish, pilose to strigose, abaxially lighter green or coppery to maroon with prominent green veins, densely to sparingly pilose, lateral veins 6–8 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–4 flowers per node, posture pendent at anthesis, bracteoles ovate, ca. 1–15 mm long, 5–7 mm wide; pedicels shorter than the petiole, 2–3 cm long, densely pilose-hirsute, pedicel enations present. Calyx lobes nearly free, usually valvate, sometimes completely separate, erect, nearly equal, 15–20 mm long, 5–10 mm wide, oblong, base truncate, apex acute, margin glandular-serrate to laciniate, dark red, abaxially sparsely to densely yellow or reddish pilose-villous, adaxially sparsely to densely yellow or reddish pilose. Corolla 3.5–5.5 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla oblique relative to calyx; base ca. 5 mm in diameter, middle slightly ampliate to uniformly tubular, throat not constricted, appearing laterally compressed, to 1.1 cm wide (at mouth), outside pilose-villous, becoming densely pilose-villous distally, inside mostly glabrous, with glandular trichomes at throat, interior spotting absent, limb reflexed, zygomorphic, ca. 1.5 cm wide, salmon to orange or red, lobes nearly equal, recurved, 3–4 mm long, ca. 5 mm wide, rotund, entire. Nectary gland bilobed or single-lobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 3 cm long, adnate to base of corolla tube for ca. 4 mm, connate for 1 mm, forming an open sheath, glabrous; anthers 1–2 mm long, 2.5–3 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 5 mm long, ca. 4 mm wide, ovoid, pilose, style ca. 3 cm long, glabrous, stigma stomatomorphic, sometimes bilobed. Fruit a fleshy capsule, pendent when ripe, ca. 2 cm long, ca. 1.8 cm wide, ovoid when immature, pilose, loculicidally dehiscent, becoming bivalved, valves reflexed, reaching a 180° angle when mature. Seeds numerous, ca. 1 mm long, ca. 0.2 mm wide, fusiform, longitudinally striate, yellow. Fig. 25.

Phenology. Collected in flower throughout the year, also in fruit, except for June and July.

Distribution (Fig. 23). Central America (Costa Rica and Panama) and northern South America (western Colombia and northwestern Ecuador); premontane and montane wet forests; sea level to 2000 m.

ADDITIONAL SPECIMENS EXAMINED. **Costa Rica.** CARTAGO: Turrialba, Tayutic, Jicotea, headwaters of Río Jicotea, Herrera 7990 (K); Cantón Paraíso, Parque Nacional Tapantí, Valle del Reventazón, Sector Quebrada Segunda, Mora 419 (BM).—LIMÓN: Cantón Talamanca, Dist. Glossoloma panamense is distinguished from its congeners by lanceolate calyx lobes (Fig. 25D); pilose indumentum on the leaves, stems, and calyx (Fig. 25A); and corollas that are uniformly ampliate (Fig. 25D) instead of pouched. A uniformly tubular corolla (i.e., not ventricose or pouched) is common in other genera of Gesneriaceae, such as *Columnea*, but is otherwise unusual in *Glossoloma*. The only other species in *Glossoloma* with a uniformly ampliate corolla tube are *G. subglabrum* (Fig. 37), *G. harlequinoides* (Fig. 17), and *G. pedunculatum* (Fig. 28).

17. *Glossoloma pedunculatum* J. L. Clark, sp. nov.—TYPE: PANAMA. Chiriquí: Distr. Gualaca, Correg. Hornito, Reserva Forestal Fortuna (Smithsonian Tropical Research Institute), sendero Alemán (near Quebrada Alemán), 08°42'46"N, 82°14'55"W, 1300 m, 28 Jul 2003, J. L. Clark 8580 (holotype: PMA!; isotypes: AAU! CAS! COL! E! F! K! MO! NY! SCZ! SEL! UNA! US!).

G. panamensi simile sed bracteis persistentibus oblongisque, inflorescentibus pedunculatis differt.

Subshrubs, terrestrial; stems erect, unbranched, to 2 m tall, to 1 cm in diameter, usually woody, succulent when young, internodes 2–10 cm long, subquadrangular, glabrescent proximally, densely brownish hirsute distally, leaf scars slightly raised from the stem surface, enations at base of petiole present. Leaves opposite, equal in a pair; petioles 2–10 cm long, sparsely pilose; blades 14–33 cm long, 5–15 cm wide, oblong to elliptic, base rounded, apex acuminate to acute, margin serrate, adaxially light green, sericeous, abaxially uniformly green to reddish green, puberulous, coriaceous when dry, lateral veins 6–9 per side. Inflorescence a congested cyme, peduncle to 2 cm long, appearing raceme-like, with 2–5 resupinate flowers per inflorescence, posture pendent at anthesis, bracteoles 2 cm long, 1.5 cm wide, oblong; pedicels shorter than the petiole, to 1.5 cm long, densely pilose, pedicel enations present. Calyx lobes nearly free, valvate to involute, each appressed to adjacent lobe, folded lengthwise with the margin curved inward, erect, nearly equal, 14–18 mm long, 5–8 mm wide, broadly ovate, base truncate, apex acute, margin serrate, all green to greenish maroon, abaxially densely pilose, adaxially sericeous. Corolla to 3.5 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla perpendicular relative to calyx; base 5 mm in diameter, middle uniformly tubular, slightly ventricose on upper surface, throat not constricted, not appearing laterally compressed, 6–8 mm wide (at

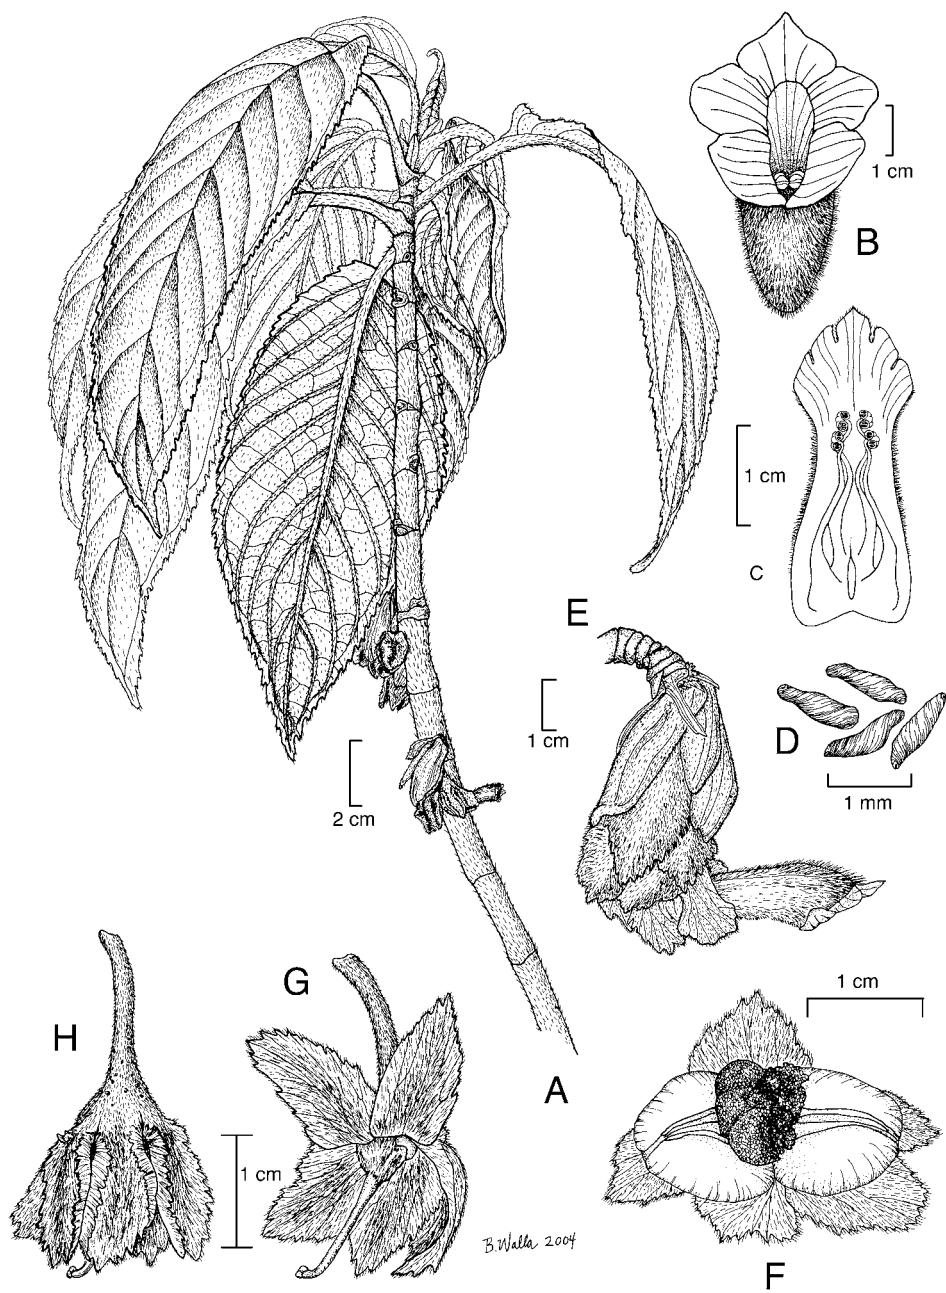

FIG. 26. *Glossoloma pedunculatum*. A. Habit. B. Face view of corolla. C. Corolla opened to show stamens. D. Seeds. E. Inflorescence with well-developed peduncle and persistent bracteoles. F. Mature fruit with reflexed valves. G. Calyx opened and corolla removed to show bilobed nectary gland and pistil. H. Calyx. (Based on J. L. Clark 8580, holotype.)

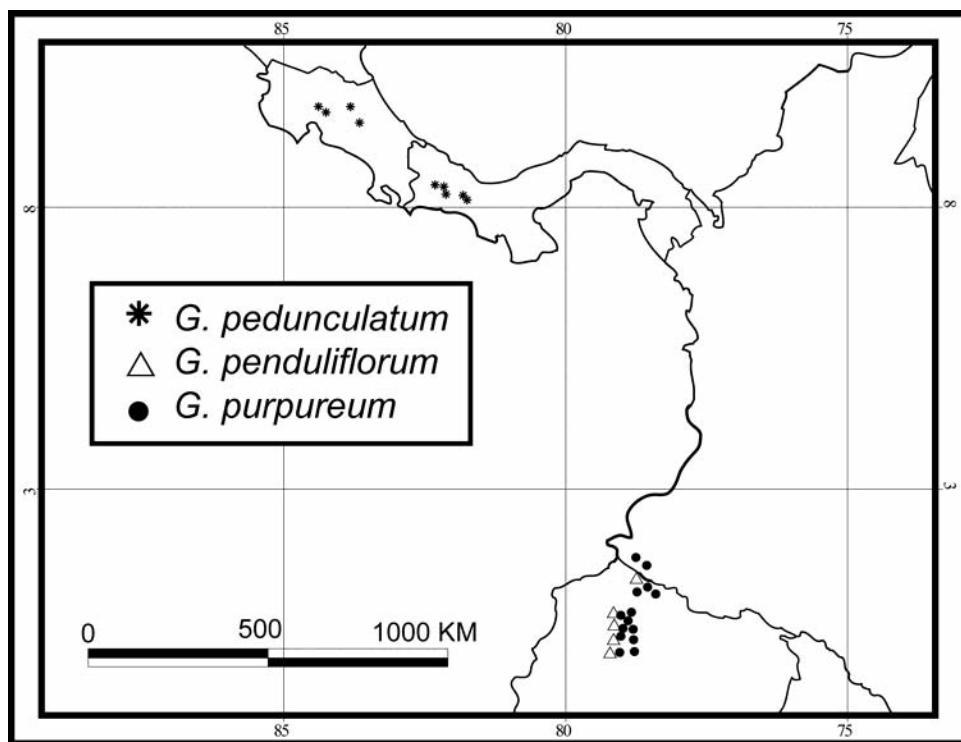

FIG. 27. Distribution of *Glossoloma pedunculatum*, *G. penduliflorum*, and *G. purpureum*.

mouth), outside pilose, inside mostly glabrous, with glandular trichomes at throat, interior spotting absent, limb reflexed, zygomorphic, ca. 1 cm wide, light red, lobes nearly equal, 4 mm long, 5 mm wide, rotund, recurved, entire. Nectary gland shallowly bilobed to truncate, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 1.5 cm long, adnate to base of corolla tube for ca. 4 mm, connate for 1 mm, forming an open sheath, glabrous; anthers 1–2 mm long, 2.5–3 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 6 mm long, ca. 3 mm wide, ovoid, pilose, style 1.4 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent when ripe, ca. 1.4 cm long, ca. 1.5 cm wide, ovoid when immature, sparsely pilose, loculicidally dehiscent, becoming bivalved, valves reflexed, reaching a 180° angle when mature. Seeds numerous, ca. 1 mm long, ca. 0.5 mm wide, ellipsoid, longitudinally striate, yellow. Frontispiece; Fig. 26.

Phenology. Flowering from May through August, February, and December, in fruit in July to September.

Distribution (Fig. 27). Western Panama in the Cordillera Central (Chiriquí, and Bocas del Toro) and Costa Rica (Alajuela, Heredia, and Cartago); 700–1700 m.

ADDITIONAL SPECIMENS EXAMINED. **Costa Rica.** ALAJUELA: Reserva Biológica Monteverde, Quebrada Celeste, Río Peñas Blancas, *Bello & Villegas* 1462 (US); along road from San Ramón N toward Balsa, 16.7 km N of bridge over Volio and 7.5 km N of bridge over Río Balsa, *Stevens* 13896 (MO, US).—CARTAGO: Tapantí Hydroelectric Project between Km 7 and 12, S of bridge over the Río Grande de Orosi at Tapantí, *Utley* 3427 (F).—HEREDIA: La Palma, Río Bajo de Honduras, Braulio Carrillo National Park, *Garwood et al.* 379 (BM).

Panama. BOCAS DEL TORO: Cerro Colorado, ca. 6.5 mi W of Chamé, *Croat* 69145 (MO).—CHIRIQUÍ: Dist. Nole Duima, Correg. Chami, Cerro Colorado, 35–50 km N of San Felix, *Antonio* 4898 (MO, US); Cerro Colorado, Mina de Cobre, 15 m beyond camp, *Besse et al.* 2407 (SEL); Dist. Gualaca, Correg. Hornito, Reserva Forestal Fortuna (Smithsonian Tropical Research Institute), *Clark* 8557 (AAU, COL, E, PMA, SCZ, SEL, UNA, US); Dist. Gualaca, Correg. Chami, Cerro Colorado, 35–50 km N of San Felix, *Clark & Morale* 8672 (K, NY, PMA, SCZ, SEL, UNA, US); Gualaca–Chiriquí Grande, 8.0 mi beyond Los Planes de Hornito, 6.9 mi beyond road turnoff to Caldera, *Croat* 67886 (MO); Bajo Mono, Boquete, Cordillera Central, road towards Culebra, trail to lake, *Cuevas* 1181 (PMA, SCZ, US); Dist. Nole Duima, Correg. Chami, Cerro Colorado, 35–50 km N of San Felix, *Dressler* 5605 (PMA, SEL, US); Cerro Colorado, road along ridge, 11.2 km from main road to Escopéta, *Folsom* 4885 (MO, US); Dist. Nole Duima, Correg. Chami, road along continental divide on top of ridge leading to Cerro Colorado, *Folsom & Mauseth* 8445 (US); 1 km N of Fortuna Lake, *Hampshire & Whiteford* 297 (BM, PMA, US).

Glossoloma pedunculatum is distinguished by the presence of a well-developed peduncle, persistent purple-tinged oblong bracteoles (Fig. 26E), and a large robust shrubby habit. This species resembles *G. panamense* in habit and the lanceolate calyx lobes, but *G. pedunculatum* is readily differentiated by the presence of obvious peduncles. The peduncles are derived from an indeterminate branching structure that subtends a terminal cluster of flowers. Most members of the tribe Episcieae appear to have axillary flowers subtended by well-developed pedicels and lack peduncles. Many species included in Episcieae appear epedunculate; however, inflorescences of Gesneriaceae are derived from a reduced pair-flowered cyme (Weber 1973, 1982, 1995, 2004; Wiehler 1983). Thus, long peduncles are not only unique for the genus *Glossoloma*, but are also unusual for the tribe Episcieae. One notable exception is *Drymonia coccinea* (Aubl.) Wiehler, which has elongate peduncles that reach 10 cm. It was noted by Kriebel (2006) that the peduncle of some individuals are reduced at flowering stage but elongate in fruit to 2.7 cm. The oblong and persistent bracteoles that cover the calyx lobes are also an unusual feature that helps to differentiate this species from other members of *Glossoloma*.

18. *Glossoloma penduliflorum* (M. Freiberg) J. L. Clark, Selbyana 25: 205. 2005. *Alloplectus penduliflorus* M. Freiberg, Phyton 37: 133. 1997.—TYPE: ECUADOR. Imbabura: Cantón Sigchos, Los Cedros Biological Reserve, 1200–1500 m, 27 Jun 1996, *M. Freiberg* 96210 (holotype: QCA, not located (see discussion); lectotype, here designated: ULM!; isotypes: ULM-2 sheets!).

Epiphyte; stems scandent, rarely branched, growing 2–5 m above ground, 3–5 mm in diameter, woody, internodes 3–12 cm long, terete, glabrescent proximally, densely pilose-villous distally, leaf scars slightly raised from the stem surface, enations at base of petiole present. Leaves opposite, nearly equal in a pair; petioles 1.5–3.0 cm long, densely pilose-villous; blades 7.5–10.5 cm long, 3–5 cm wide, ovate to elliptic-ovate, base obtuse to rounded, apex acute, margin serrate to denticulate, adaxially dark green, strigose, abaxially pale green, pilose, membranous when dry, lateral veins 6–8 per side. Flowers solitary, resupinate, posture pendent at anthesis, bracteoles absent; pedicels longer than the petiole, 8–15 cm long, densely pilose-villous, pedicel enations absent. Calyx lobes nearly free, usually separate, sometimes slightly valvate, erect, 4 equal, to 30 mm long, 5–8 mm wide, narrowly oblong, base truncate, apex acute, margin fimbriate, the teeth to 5 mm long, green, abaxially densely pilose, adaxially densely pilose; fifth (ventral) lobe smaller and narrower, to 3 cm long, to 0.4 cm wide, broadly oblong. Corolla 5.5–6.0 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla oblique relative to

calyx; base ca. 1 cm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat not constricted, appearing laterally compressed, to 2.3 cm wide (at mouth), outside pilose, inside mostly glabrous, with glandular trichomes at throat, interior spotting absent, limb reflexed, zygomorphic, ca. 2.3 cm wide, mostly brick-red, base white, lobes nearly equal, ca. 5 mm long, ca. 9 mm wide, rotund, entire. Nectary gland usually bilobed, sometimes trilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 3.5 cm long, adnate to base of corolla tube for ca. 5 mm, connate for 1 mm, forming an open sheath, sparingly pilose with some glandular trichomes; anthers ca. 1.5 mm long, ca. 3 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 6 mm long, ca. 5 mm wide, ovoid, densely pilose, style 3.2 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent, ca. 1.2 cm long, ca. 1.0 cm wide, ovoid when immature, pilose, loculicidally dehiscent, becoming bivalved when mature. Seeds numerous, ca. 1 mm long, ca. 0.3 mm wide, fusiform, longitudinally striate, brown. Fig. 28.

Phenology. Collected in flower in January, March, May, June, September, and December, in fruit in January.

Distribution (Fig. 27). Eastern slopes of the Ecuadorian Andes (Carchi, Cotopaxi, Esmeraldas, Imbabura, and Pichincha); montane and premontane forests; 900–1900 m.

ADDITIONAL SPECIMENS EXAMINED. **Ecuador.** CARCHI: environs of Chical, 12 km below Maldonado on the Río San Juan, *Madison et al.* 4449 (SEL).—COTOPAXI: Cantón Sigchos, Parroquia San Francisco de las Pampas, Bosque Integral Otonga, *Clark & Muñoz* 6115 (AAU, COL, F, MO, NY, QCA, QCNE, US); Cantón Sigchos, Parroquia San Francisco de las Pampas, Bosque Integral Otonga, *Clark & Muñoz* 6122 (AAU, COL, K, MO, NY, QCA, QCNE, SEL, UNA, US); San Francisco de las Pampas, Bosque Integral Otonga, *Freiberg* 96288 (QCA).—ESMERALDAS: Cantón San Lorenzo, Parroquia Alto Tambo, 4–8 km W of El Cristal, *Clark et al.* 10268 (MO, QCNE, SEL).—IMBABURA: Cantón Cotacachi, Parroquia García Moreno, Cordillera de Toisán, Cerro de la Plata, Bosque Protector Los Cedros, Sendero Observatorio (SW of lodge), *Clark et al.* 7405 (AAU, COL, MO, NY, QCA, QCNE, SEL, UNA, US).—PICHINCHA: Saloya, descenso W of Cordillera Occidental, *Acosta Solis* 5819 (F); Parroquia Pacto–Gualca, road towards Buenos Aires, *Aimacaña & Guzmán* 347 (QAP); Cantón Quito, Parroquia Nanegalito, headwaters of Río Pachijal, Sector Rancho Buitrón, *Cerón M.* 38338 (QAP); Cantón Los Bancos, Bosque Protector San Francisco, Sector la Chorrera, between Río Chalhuayacu and Río Tigre, *Cerón M. & Sarabia* 42795 (QAP, US); road El Paraíso–Saguangal, 11 km from El Paraíso, *Øllgaard et al.* 37632 (AAU).

Glossoloma penduliflorum is distinguished from other members of the genus by pendent flowers subtended by an elongate pedicel, 8–15 cm long (Fig. 28A), and an obligate epiphytic habit; most species of *Glossoloma* are primarily erect unbranched terrestrial subshrubs. Those species that are epiphytic (e.g., *G. herthae* and *G. bolivianum*) can be differentiated from *G. penduliflorum* by their non-elongate and non-scandent stems, except the scandent *G. scandens*, which is easily differentiated from *G. penduliflorum* by short pedicels and nearly sessile flowers.

In the protologue of *G. penduliflorum* (Freiberg 1997) the holotype is cited as *Freiberg 96210* at QCA and isotypes deposited at QCNE and ULM. Yet, the collection annotated at QCA as the holotype by Freiberg is his field collection 96288. As of 2007, neither a specimen of *Freiberg 96210* has been found at QCA, nor are there any known Freiberg collections at QCNE. It is likely that two of the three specimens comprising *Freiberg 96210* (annotated as isotypes) at ULM have not yet been distributed to QCA and QCNE. This inconsistency was brought to the attention of ULM and M. Freiberg in 2003. Therefore, one of the three collections at ULM is selected here as the lectotype.

Glossoloma penduliflorum is listed by the IUCN Red List Categories and Criteria as Vulnerable D2 in the *Libro rojo de las plantas endémicas del Ecuador 2000* (Clark & Skog 2000). The designation criteria for Vulnerable D2 means that the species is known only

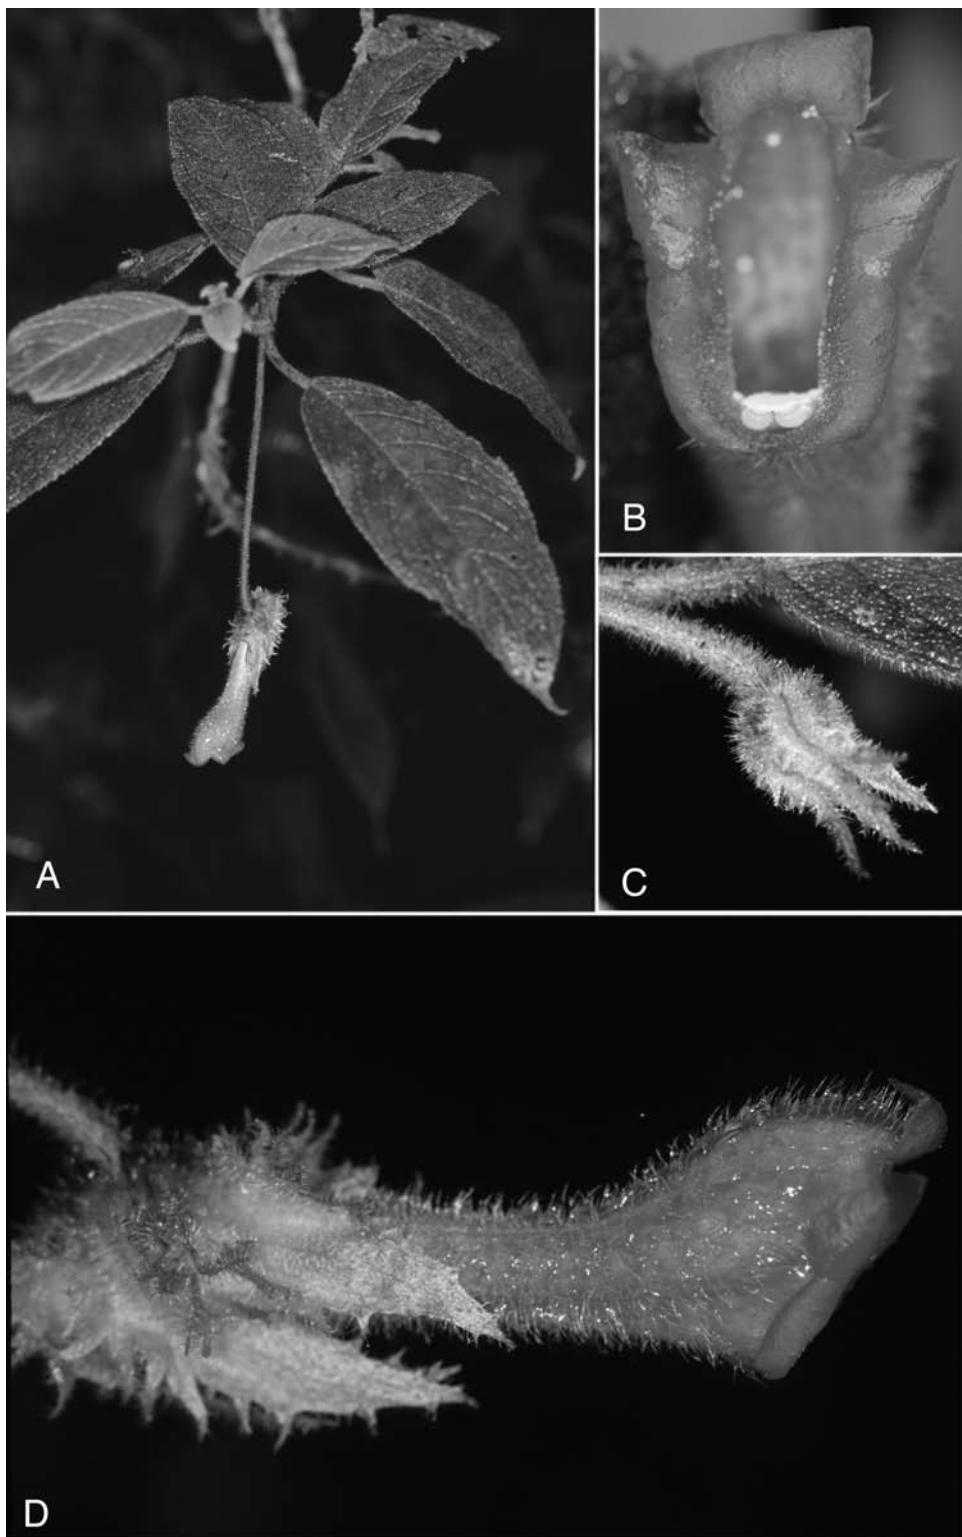

FIG. 28. *Glossoloma penduliflorum*. A. Habit. B. Face view of flower. C. Immature calyx. D. Lateral view of flower. (Photos by J. L. Clark; voucher: J. L. Clark et al. 7405.)

from a very restricted area (typically less than 20 km²). All species with this designation may become Critically Endangered or even Extinct in a very short time period. Only two populations of *G. penduliflorum* are well known, but a third population was discovered during a 2008 collecting expedition in the northern limits of the Esmeraldas province of Ecuador (*Clark et al. 10268*).

19. *Glossoloma purpureum* (L. P. Kvist & L. E. Skog) J. L. Clark, Selbyana 25: 205.

2005. *Alloplectus purpureus* L.P. Kvist & L. E. Skog, Brittonia 44: 475. 1992.—

TYPE: ECUADOR. Pichincha: Quito Cantón, road El Paraíso–Saguangal, Km 11, 00°12'N, 78°46'W, 1200 m, 2 May 1982, *B. Øllgaard et al.* 37673 (holotype: AAU!).

Subshrubs, terrestrial, rarely epiphytic; stems erect, unbranched, to 2 m tall, 4–8 mm in diameter, subwoody, internodes 1–9 cm long, subquadrangular, glabrescent proximally, densely pilose-villous distally, leaf scars slightly raised from the stem surface, enations at base of petiole present. Leaves opposite, equal or subequal in a pair; petioles 1.0–2.5 cm long, strigose; blades 7–15 cm long, 2.5–6.0 cm wide, oblong-lanceolate, base acute-cuneate, apex acuminate, margin serrate to denticulate, adaxially dark green, glabrous or sparsely pilose, abaxially dark purple, sparsely puberulent and pilose to villous at veins, membranous when dry, lateral veins 6–8 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–2 flowers per node, posture pendent at anthesis, bracteoles 5–10 mm long, 3–5 mm wide, ovate-lanceolate to triangular; pedicels longer than the petiole, 1.5–4.0 cm long, pilose, pedicel enations absent. Calyx lobes nearly free, each appressed to adjacent lobe, folded lengthwise with the margin curved inward, erect, 4 equal, 25–35 mm long, 3–12 mm wide, broadly ovate, base truncate, apex acute, margin fimbriate, the teeth to 1.5 cm long and ca. 0.3 cm wide, green, abaxially glabrescent to pilose, adaxially sparingly pilose; fifth (ventral) lobe smaller and narrower, to 3.5 cm long, to 0.4 cm wide, broadly oblong. Corolla 3.7–5.5 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla oblique relative to calyx; base ca. 8 mm, middle ampliate, becoming apically ventricose on upper surface, throat not constricted, appearing laterally compressed, ca. 1.3 cm wide (at mouth), outside sparingly pilose becoming densely pilose distally, inside mostly glabrous, with glandular trichomes at throat, interior spotting absent, limb reflexed, zygomorphic, ca. 1.3 cm wide, bright yellow, lobes nearly equal, 2–3 mm long, 3–5 mm wide, rotund, upper lobe more erect, entire. Nectary gland bilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion 3.0–3.5 cm long, adnate to base of corolla tube for ca. 6 mm, connate for 2 mm, forming an open sheath, glabrous; anthers ca. 1.5 mm long, ca. 2.5 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 8 mm long, ca. 9 mm wide, ovoid, densely sericeous, style 2.5–3.0 cm long, glabrous, stigma crateriform-capitate. Fruit a fleshy capsule, pendent, ca. 1.4 cm long, ca. 1.0 cm wide, ovoid when immature, sericeous, loculicidally dehiscent, becoming bivalved, valves reflexed, reaching a 180° angle when mature. Seeds numerous, 0.8 cm long, 0.3 mm wide, ellipsoid, longitudinally striate, yellow. Fig. 29.

Phenology. Flowering throughout the year; collected in fruit in February to April.

Distribution (Fig. 27). Eastern slopes of the Ecuadorian Andes (Carchi, Cotopaxi, Imbabura, and Pichincha) and Colombia (Nariño); montane and premontane forests; 900–2000 m.

Glossoloma purpureum has long-fimbriate calyx margins, lanceolate leaves, adaxially dark green and abaxially dark purple, and an unbranched shrubby terrestrial habit. The dark purple abaxial leaf surface is a reliable character and is even present on young foliage. Fimbriate calyx margins are also found in *G. sprucei*, *G. anomalum*, and *G. medusaeum*. *Glossoloma sprucei* differs in its distinctive ovate calyx lobes, densely villous yellowish brown pubescence, and large (up to 27 × 20 cm) ovate leaf blades. *Glossoloma anomalum* is distinguished from *G. purpureum* by the presence of non-resupinate flowers (Fig. 8) and

hispid trichomes throughout. *Glossoloma medusaeum* tends to have more flowers (3+) in the leaf axils compared to the few flowers per axil in *G. purpureum* (1–3).

20. *Glossoloma pycnosuzygium* (J. Donnell Smith) J. L. Clark, Selbyana 25: 205. 2005.

Besleria pycnosuzygia J. Donnell Smith, Bot. Gaz. 52: 53. 1911. *Alloplectus pycnosuzygius* (J. Donnell Smith) C. V. Morton, Fieldiana, Bot. 28: 522. 1953.—TYPE: COSTA RICA. San José: forests at La Palma, 1459 m, 8 Sep 1898, A. Tonduz 12545 (lectotype, designated by Clark, 2005: US!; isolectotypes: US-5 sheets!).

Alloplectus glabrescens C. V. Morton, Fieldiana, Bot. 28: 522. 1953.—TYPE: VENEZUELA. Mérida: north of Torondoy, along Quebrada Molino, in woods above Las Cuadras, 1820–2255 m, 27 Mar 1944, J. A. Steyermark 55818 (holotype: US!; isotype: F!).

Shrubs, epiphytic; stems dorsiventral, rarely branched, to 2.5 m tall, 5–8 mm in diameter, woody, internodes 1.5–7.6 cm long, terete, glabrescent proximally, strigillose distally, leaf scars slightly raised from the stem surface, enations at base of petiole present. Leaves opposite, nearly equal in a pair; petioles to 2 cm long, puberulent; blades 5.4–19.8 cm long, 1.6–7.2 cm wide, obliquely elliptic to obovate or oblanceolate, base acute to truncate, apex acuminate, margin usually entire, rarely serrulate, adaxially green, glabrous, abaxially pale green, usually glabrous, rarely sparsely pubescent on prominent veins, subcoriaceous when dry, lateral veins 5–7 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–6 flowers per node, posture pendent at anthesis, bracteoles oblong, 4–5 mm long, 3–4 mm wide; pedicels shorter than the petiole, 0.6–1.4 cm long, strigillose, pedicel enations present. Calyx lobes imbricate, nearly free, imbricate, erect, nearly equal, 4–8 mm long, 3–4 mm wide, broadly ovate to oblong, base truncate, apex acute, margin crenulate to entire, red or green, abaxially puberulous, adaxially glabrous, white-pilose at base. Corolla 1.0–2.5 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla perpendicular relative to calyx; base 3–4 mm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat slightly constricted, appearing laterally compressed, to 1.1 cm wide (at mouth), outside densely pilose or sericeous, inside sparingly pilose, sometimes with glandular trichomes apically, red spotting sometimes present on the upper surface of throat, limb reflexed, subregular, ca. 1.1 cm wide, appearing pink, from white pilose or sericeous hairs covering the red surface, lobes nearly equal, 2–3 mm long, 2–3 mm wide, rotund, entire. Nectary gland bilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 1.2 cm long, adnate to base of corolla tube for ca. 3 mm, connate for 1 mm, forming an open sheath, glabrous; anthers ca. 1 mm long, ca. 2 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 3.5 mm long, ca. 3 mm wide, ovoid, villous, style ca. 1.5 cm long, sparsely pubescent, stigma stomatomorphic. Fruit a fleshy capsule, pendent, ca. 7 mm long, ca. 6 mm wide, ovoid when immature, villous, loculicidally dehiscent, becoming bivalved when mature, reddish to white. Seeds numerous, 0.8 cm long, 0.3 mm wide, ellipsoid, longitudinally striate, brownish red. Fig. 30.

Phenology. Flowering in January, March, July to October, and December, in fruit in September and October.

Distribution (Fig. 31). Costa Rica (San José and Cartago), Panama (Chiriquí and Bocas del Toro), and Venezuela (Mérida and Carabobo); montane forests; 1300–2200 m.

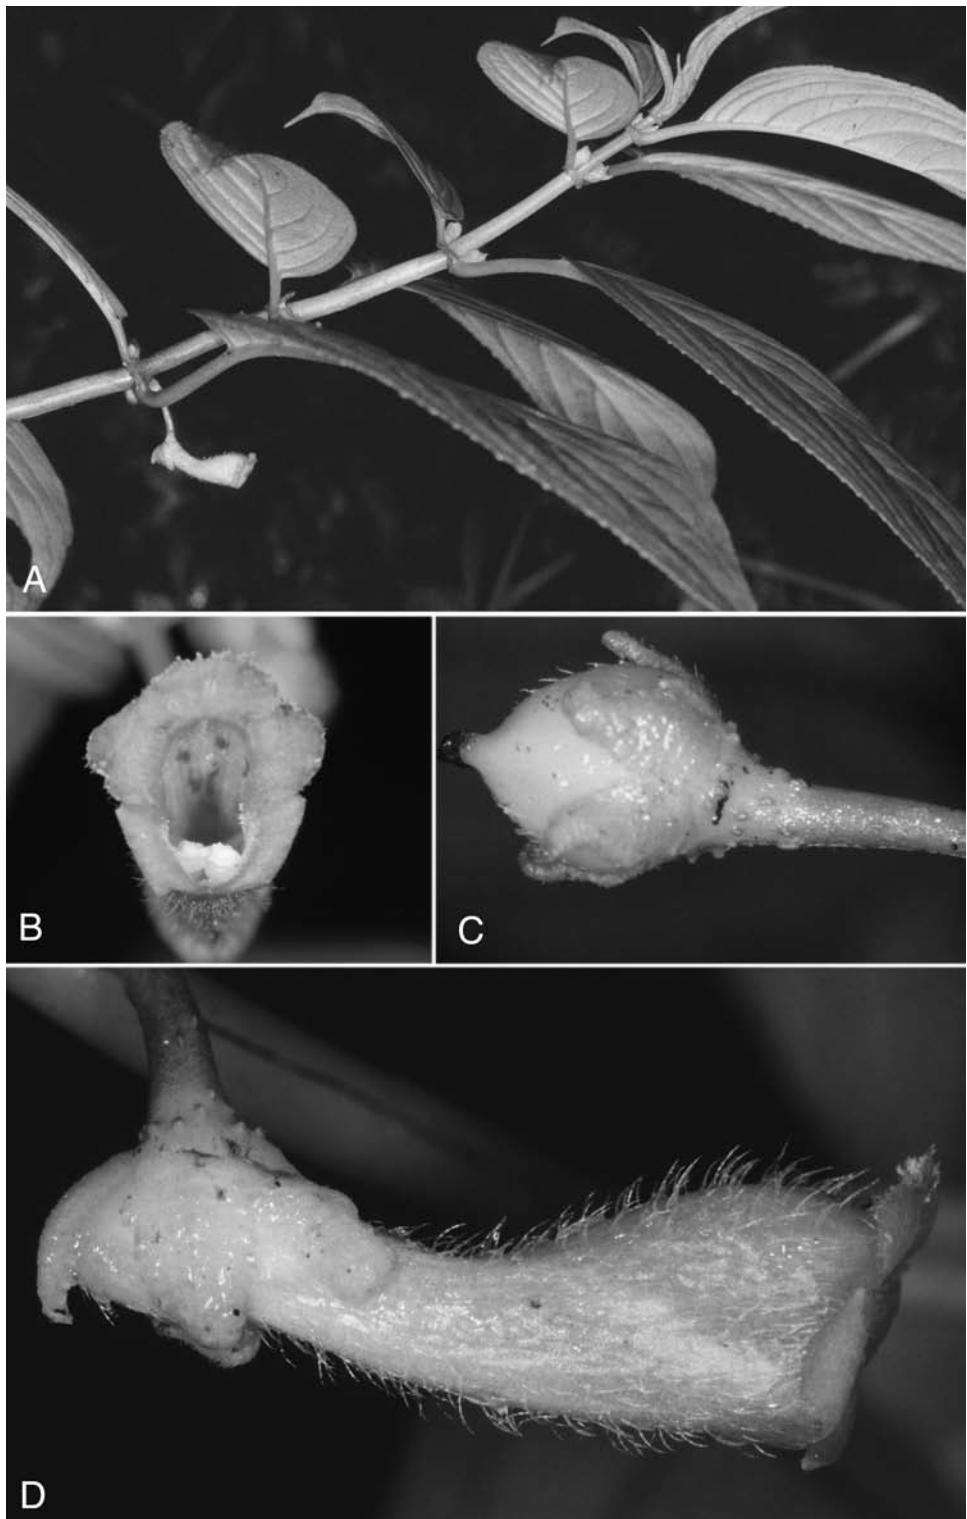

FIG. 30. *Glossoloma pycnosuzygium*. A. Habit. B. Face view of flower. C. Immature fruit. D. Lateral view of flower. (Photos by J. L. Clark; voucher: J. L. Clark & S. Yustiz 6861.)

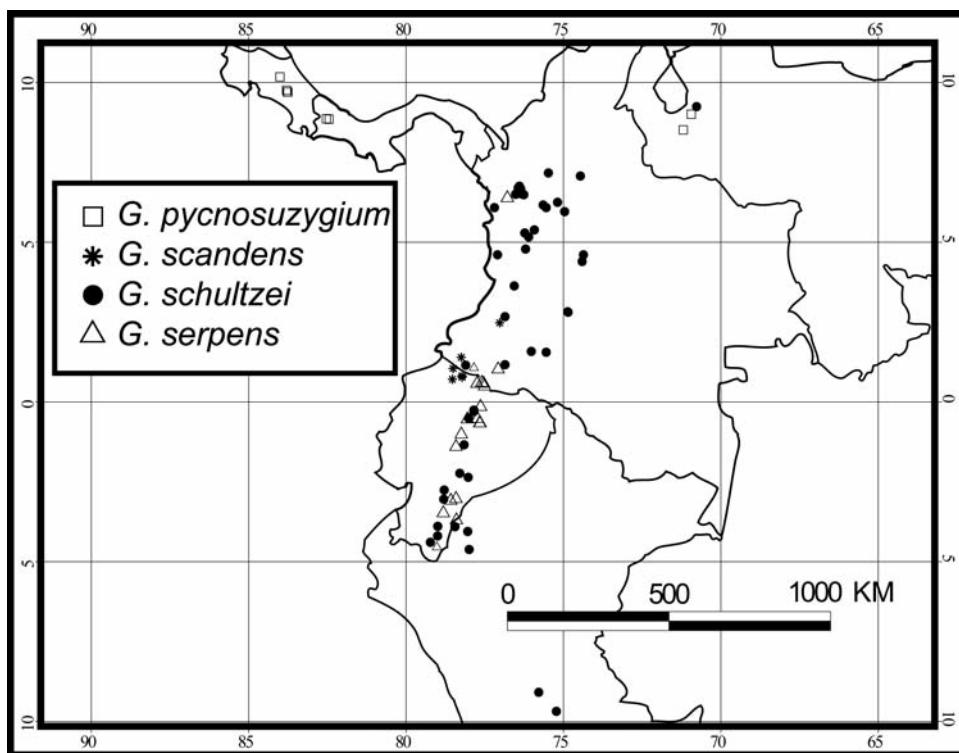

FIG. 31. Distribution of *Glossoloma pycnosuzygium*, *G. scandens*, *G. schultzei*, and *G. serpens*.

ADDITIONAL SPECIMENS EXAMINED. **Costa Rica.** CARTAGO: near Río Villegas, valley of Río Grande de Orosi, Lent 1862 (F, NY).—SAN JOSÉ: Palma, Brade 2208 (BR); old road to Limón, 7.4 km N of San Jerónimo at La Palma, Hill *et al.* 17753 (US); along road that leads down from Alta La Palma to the Río Honduras, ca. 15 km NE of Santa Domingo, Taylor 17870 (F, US); forests and environs of La Palma, Tonduz 12548 (US-2 sheets); between Alto de La Palma and Bajo de Honduras, Utley & Utley 611 (F); La Honduras de San José, Valerio 741 (F). **Panama.** BOCAS DEL TORO: Robalo trail, northern slopes of Cerro Horqueta, Allen 4996 (BR, EAP, F, G, GH, K, MO, NY, P, S-2 sheets, U, US-2 sheets); trail to La Laguna, Boquete, Montenegro *et al.* 1296 (PMA-2 sheets, SCZ).—CHIRQUI: environs of Bajo Chorro, Woodson & Schery 683 (MO).

Venezuela. CARABOBO: Pittier 8957 (GH).—MÉRIDA: Justo Briseño, Quebrado El Molino (near Las Cuadras), Clark & Yustiz 6861 (NY, MER, PORT, SEL, UNA, US, VEN).

Glossoloma pycnosuzygium is characterized by horizontal to dorsiventral stems, obliquely elliptic to obovate or oblanceolate leaves, a uniformly red corolla that is held nearly perpendicular relative to the calyx, and imbricate calyx lobes. It is distinguished from other species in the genus by the relatively small calyx lobes (4 × 3 mm) that are imbricate in flower but spreading in fruit. Also distinctive is the lack of trichomes on the leaf surfaces. This species resembles *G. herthae*, because both have a similar scandent habit and imbricate calyx lobes. These two species are geographically isolated; *G. pycnosuzygium* occurs in Costa Rica, Panama, and Venezuela, and *G. herthae* in Colombia, Ecuador, and Peru. They are also easily differentiated by corolla size, in *G. pycnosuzygium* 1.0–2.5 cm long and in *G. herthae* ca. 4–5 cm long.

The disjunct distribution of *G. pycnosuzygium* in Central and South America is

unusual for Gesneriaceae. A similar disjunct pattern has been documented for *Columnea oerstediana* Klotzsch ex Oerst. and *Columnea calotricha* Donn. Sm. Future fieldwork will likely discover populations in many of the unexplored and relatively poorly known areas of Colombia.

21. *Glossoloma scandens* J. L. Clark, sp. nov.—TYPE: ECUADOR. Carchi: Cantón Tulcán, Parroq. Chical, trail along Río Blanco via the Cordillera Gualchán, 6–8 km SW of Chical on trail towards Cristal, 00°53'49"N, 78°07'03"W, 1200–1800 m, 7 Dec 2001, J. L. Clark, O. Mejia & E. Díaz 6356 (holotype: QCNE!; isotypes: AAU! COL! K! NY! QCA! SEL! US!).

G. herthaе simile sed lobis calycis fere aequalibus subliberisque, corollis minoribus (usque 2.5 cm vs. 3.6 cm) differt.

Obligate epiphyte; stems elongate, scandent, frequently branched, to more than 2.0 m long, slender, 4–8 mm in diameter, woody, internodes 2–6 cm long, terete, glabrescent proximally, puberulous distally, leaf scars slightly raised from the stem surface. Leaves opposite, nearly equal in a pair; petioles 1–2.5 cm long, puberulous; blades 4–14 cm long, 1.5–3.5 cm wide, elliptic to oblong, base acute, apex acuminate, margin serrate, adaxially light green, glabrous, abaxially green to light red, puberulous, membranous when dry, lateral veins 6–9 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–3 flowers per node, pendent at anthesis, bracteoles 2–6 mm long, 1 mm wide, linear; pedicels equal to or shorter than the petiole, to 1 cm long, sericeous, pedicel enations absent. Calyx lobes nearly free, valvate to spreading, erect, equal, 12 mm long, 4 mm wide, linear, base truncate, apex acute, margin dentate-serrate, green to red, abaxially sparingly pilose, adaxially pilose. Corolla to 2.5 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla nearly perpendicular relative to calyx; base 5 mm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat not constricted, appearing laterally compressed, 10 mm wide (at mouth), outside glabrous at base, becoming sparingly to densely hirsute distally, inside mostly glabrous, with glandular trichomes at throat, interior spotting absent, limb reflexed, zygomorphic, to 1 cm wide, red (Ecuador) or yellow (Colombia), lobes nearly equal, 2 mm long, 3 mm wide, rotund, entire. Nectary gland emarginate to truncate, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 1.3 cm long, connate at base for 3 mm, adnate to base of corolla tube for ca. 2 mm, glabrous; anthers 1 mm long, 1.5 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 4 mm long, ca. 3 mm wide, ovoid, densely pilose, style ca. 1.3 cm long, glabrous, stigma stomatomorphic. Fruit not seen. Fig. 32.

Phenology. Flowering in February, March, May, July, November, and December.

Distribution (Fig. 31). Eastern Andes of Colombia (Cauca and Nariño) and Ecuador (Carchi, Esmeraldas, and Imbabura); shaded areas of montane forests; 900–1700 m.

ADDITIONAL SPECIMENS EXAMINED. **Colombia.** DEPARTMENT UNKNOWN: Cordillera Teca, Goudot 7 (P).—CAUCA: Mpio. El Tambo, Parque Nacional Munchique, Cordillera Occidental, below the Refugio de la Galla (from Km 81), Lozano C. et al. 6511 (COL).—NARIÑO: Trayecto Pielapi-La Planada, Benavides 10137 (MO, US); Pielapi, valley of Río Pielapi, Gentry et al. 63697 (MO); near Ecuador border, along trail above San Juan River near Maldonado, Hoover 1037 (MO-2 sheets, US). **Ecuador.** CARCHI: Cantón Tulcán, Parroquia Chical, trail from the village of Quinyal towards Gualpi, near border of the Reserva Awa, Clark & Mejia 6311 (AAU, COL, E, MO, NY, QCA, QCNE, SEL, US); trail beginning above Rafael Quindi Finca, above Untal (along road to Chical) and partly ascending Cerro Obsura, 0.6 km from finca, Hoover & Wormley 1476 (MO); trail beginning

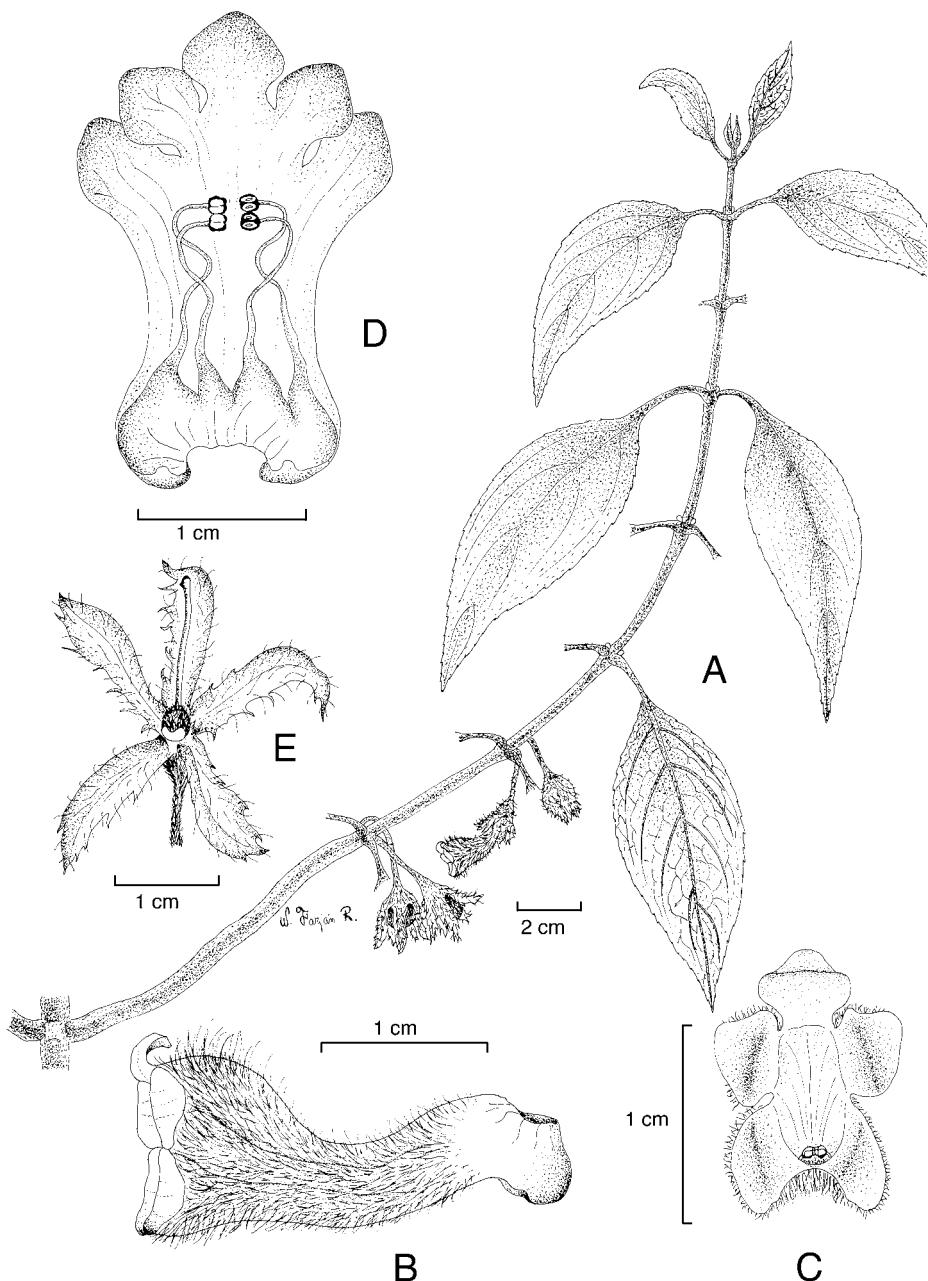

FIG. 32. *Glossoloma scandens*. A. Habit. B. Side view of corolla. C. Face view of flower. D. Corolla opened to show stamens. E. Calyx opened and corolla removed to show pistil and bilobed nectary gland. (Based on J. L. Clark *et al.* 7510.)

above Rafael Quindi Finca, above Untal (along road to Chical) and partly ascending Cerro Obsura, 0.6 km from finca, *Hoover & Wormley 1659* (QCA), *Hoover & Wormley 1660* (MO); environs of Chical, 12 km below Maldonado on the Río San Juan, *Madison et al. 4524* (F, SEL).—ESMERALDAS: Cantón San Lorenzo, Parroquia Alto Tambo, 4–8 km W of El Cristal, *Clark et al. 10324* (MO, QCNE, SEL).—IMBABURA: Cantón Ibarra, Parroquia Lita, comunidad San Francisco, next to Río Verde, 13 air-km S of Lita, *Clark et al. 7510* (AAU, CAS, COL, CUZ, E, F, K, MO, NY, QCA, QCNE, SEL, UNA, US).

Glossoloma scandens is distinguished from its congeners by the nearly actinomorphic calyx. The calyx lobes themselves are also distinct in their valvate to spreading arrangement. *Glossoloma scandens* is an obligate epiphyte and is usually found growing 1–2 meters above the ground. The obligate epiphytic habit is known in only one other member of the genus, *G. penduliflorum*, but *G. scandens* is easily differentiated by smaller flowers (2.5 cm long) and pedicels less than 1 cm long; in *G. penduliflorum* the flowers are 5.5–6.0 cm long and the pedicels 8–15 cm long. These two species grow sympatrically and have been collected on the same day in the environs of the town of El Cristal in the Esmeraldas province in northwestern Ecuador (*Clark 10268, 10325*).

22. *Glossoloma schultzei* (Mansfeld) J. L. Clark, Selbyana 25: 206. 2005. *Alloplectus schultzei* Mansfeld, Repert. Spec. Nov. Regni Veg. 36: 124. 1934.—TYPE: COLOMBIA. Cundinamarca: Bergurwald bei [mountain jungle near] Aguadita [5 km NE of Fusagasugá], 12 Apr 1925, A. Schultze 212 (holotype: B, destroyed).—TYPE: COLOMBIA. Cundinamarca: mountains W of Salto de Tequendama, laguna de Catarnica, S of Santandercito, 2000 m, 31 Oct 1959, L. Uribe U. 3414 (neotype, designated by Clark, 2005: US!).

Subshrubs, terrestrial; stems erect, usually unbranched, sometimes sparingly branched, to 3 m tall, to 1.5 cm in diameter, woody, internodes 2–10 cm long, subquadangular, glabrescent proximally, densely brownish yellow villous distally, leaf scars raised from stem surface, enations at base of petiole present. Leaves opposite, equal or subequal in a pair; petioles 5–15 cm long, densely to sparsely brownish yellow villous; blades 18–33 cm long, 9–18 cm wide, ovate, base usually cordate, sometimes rounded, apex acute, margin sharply serrulate to denticulate, adaxially green, mostly puberulous and sparingly strigose, abaxially green, mostly puberulous, strigose on prominent veins, subcoriaceous when dry, lateral veins 7–9 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 2–10 flowers per node, posture pendent at anthesis, bracteoles 20–35 mm long, 10–20 mm wide, ovate; pedicels shorter than the petiole, 2–6 cm long, sparsely villous with erect hairs, pedicel enations present. Calyx lobes nearly free, each appressed to adjacent lobe, folded lengthwise with the margin curved inward, erect, 4 equal, 20–35 mm long, 10–18 mm wide, ovate, base cordate, apex acute, margin serrate, mostly red, sometimes appearing white at base from the densely villous pubescence, abaxially sparingly to more densely villous at base, adaxially sparingly to more densely villous at base; fifth (ventral) lobe smaller and narrower, to 2.0 cm long, to 1.0 cm wide, ovate. Corolla 4–5.5 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla oblique relative to calyx; base 6–9 mm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat not constricted, appearing laterally compressed, 1.4–1.6 cm wide (at mouth), outside glabrous at base, sparingly to densely pilose, inside mostly glabrous, becoming glandular apically, red spotting sometimes present on the upper surface of throat, limb reflexed, zygomorphic, to 1 cm wide, usually red, sometimes red-orange, base white, lobes nearly equal, ca. 4 mm long, ca. 5 mm wide, rotund,

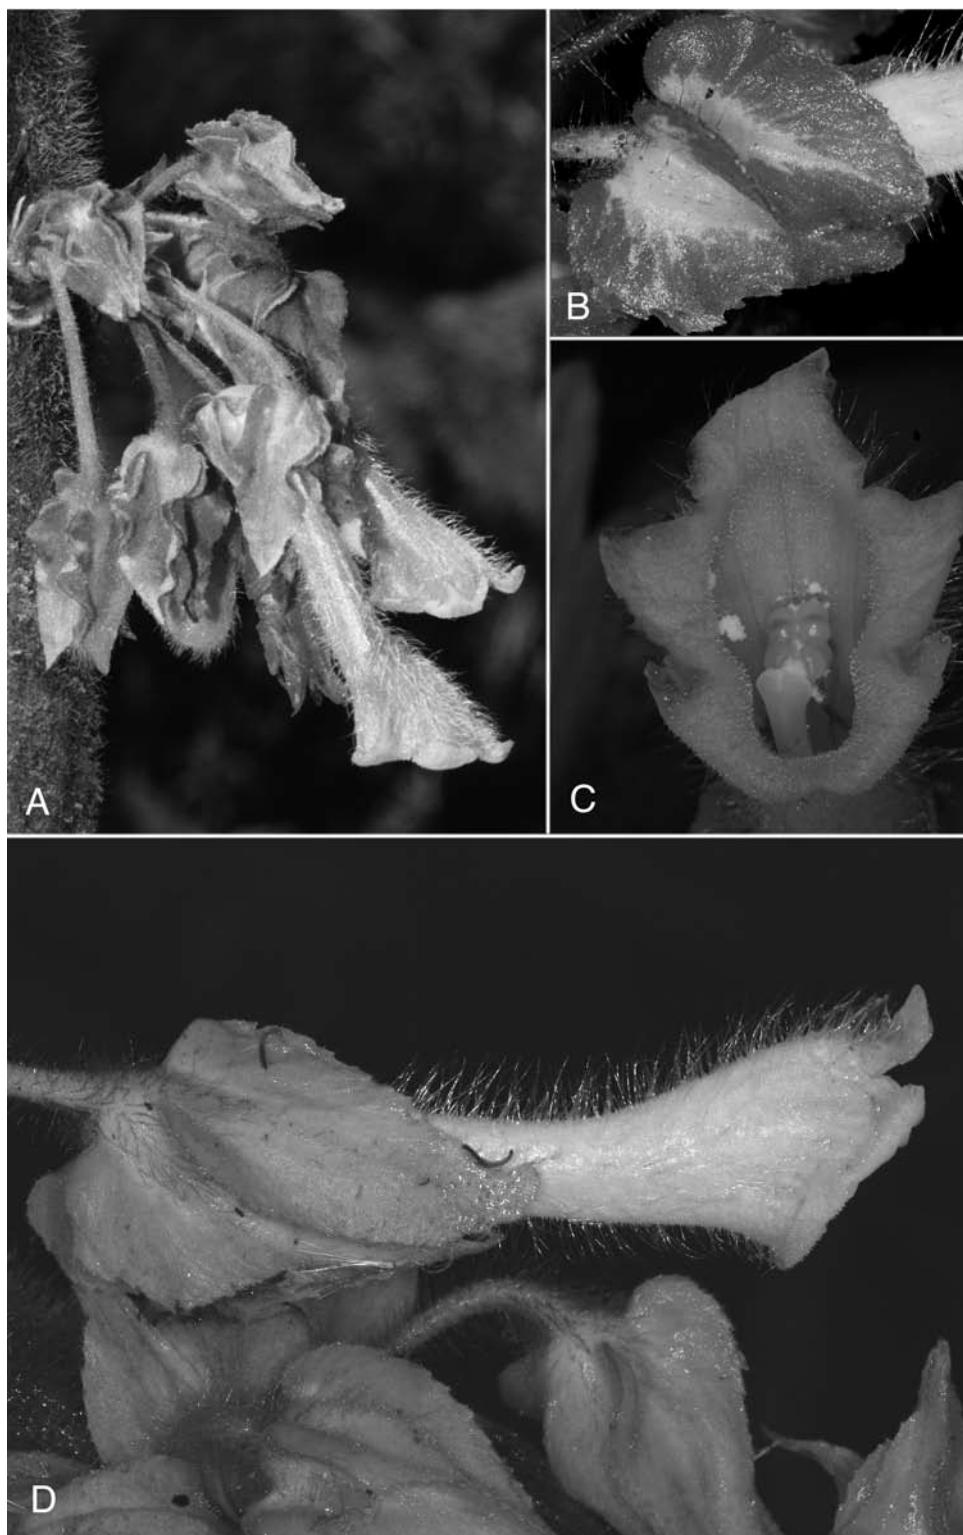

FIG. 33. *Glossoloma schultzei*. A. Cluster of axillary flowers subtended by a bracteole. B. Calyx. C. Face view of corolla. D. Lateral view of flower. (Photos by J. L. Clark; vouchers: A, J. L. Clark *et al.* 5993; B, J. L. Clark & J. Rea 8038; C, D, J. L. Clark 9851)

entire. Nectary gland usually bilobed, sometimes single-lobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 3 cm long, adnate to base of corolla tube for ca. 5 mm, connate for 1 mm, forming an open sheath, glabrous; anthers 2 mm long, 3 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 6 mm long, ca. 4 mm wide, ovoid, puberulous, style to 2.7 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent, ca. 1.3 cm long, ca. 1.4 wide, ovoid when immature, pilose, loculicidally dehiscent, becoming bivalved, valves reflexed, reaching a 180° angle when mature. Seeds numerous, 1 mm long, 0.3 mm wide, fusiform, longitudinally striate, brownish red. Fig. 33.

Phenology. Flowering throughout the year; collected in fruit in February to May, July to September, and November.

Distribution (Fig. 31). Andes of Peru, Ecuador, Colombia, and Venezuela; montane and premontane forests; sea level to 2500 m.

ADDITIONAL SPECIMENS EXAMINED. **Colombia.** DEPARTMENT UNKNOWN: Río Nembi, André 3353 (K); *Mutis* 923 (MA); White 8 (K).—ANTIOQUIA: Mpio. Glossoloma schultzei is characterized by a shrubby robust unbranched habit; dense, brownish yellow, villous indument on the stems and young leaves; and large subcoriaceous leaves (33 × 18 cm). It is often confused with other sympatric shrubby species (e.g., *G. grandicalyx*, *G. panamense*, and *G. tetragonoides*), and can be differentiated by the dense pubescence on the stems and the axillary fascicles of 4–10 flowers subtended by relatively short pedicels (2–4 cm). Other subshrubs that are confused with *G. schultzei* have fewer flowers per fascicle and longer pedicels (> than 3 cm).

Glossoloma schultzei is most commonly collected in Colombia where it occurs in the eastern, western, and central Cordilleras. In Ecuador it has been collected in all of the provinces that flank the eastern Andean slopes. It is infrequently recorded from Peru (Amazonas, Cuzco, and Huánuco) and Venezuela (Bolívar, Mérida, and Trujillo).

23. *Glossoloma serpens* (J. L. Clark & L. E. Skog) J. L. Clark, Selbyana 25: 206. 2005.

Alloplectus serpens J. L. Clark & L. E. Skog, Novon 15: 76. 2005.—TYPE: ECUADOR. Morona-Santiago: Cantón Limón-Indanza, main road between Gualaceo and Plan de Milagro, ‘Tinajillas,’ cow pasture and patches of montane forest, 03°00'19"N, 78°36'36"W, 2800 m, 10 Jan 2001, *J. L. Clark, F. Sánchez & L. Jost* 5904 (holotype: QCNE!; isotypes: AAU! COL! E! F! HA! K! MO! NY! QCA! SEL! US!).

Subshrubs, epiphytic; stems horizontal, rarely branched, to 2 m long, 3–5 mm in diameter, woody, internodes 3–11 cm long, subquadrangular, glabrescent proximally, densely hirsute distally, leaf scars slightly raised from the stem surface, enations at base of petiole present. Leaves opposite, equal or subequal in a pair; petioles 1–5 cm long, densely yellow pilose; blades 4–15 cm long, 3–10 cm wide, ovate, base acute to rounded, occasionally oblique, apex acute, margin serrate to crenate, adaxially green, sparsely pilose, abaxially uniformly pale green to uniformly red, sparsely to densely pilose (especially on veins), membranous when dry, lateral veins 5–7 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–3 flowers per node, posture pendent at anthesis, bracteoles 1–2 cm long, 0.5–1.0 cm wide, ovate; pedicels shorter to longer than the petiole, 1–3.5 cm long, densely pilose, pedicel enations present. Calyx lobes conduplicate, the apex free and the base of each appressed to adjacent lobe, folded lengthwise with

the margin curved inward, erect, subequal, 20–25 mm long and wide, broadly ovate, base sagittate, apex rounded, margin serrate, red, abaxially sparingly pilose with the midvein densely pilose, adaxially pilose. Corolla 2–4 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla perpendicular relative to calyx; base 9–11 mm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat slightly constricted, appearing laterally compressed, to 0.5 cm wide (at mouth), outside glabrous at base, otherwise densely pilose, inside mostly glabrous, becoming glandular apically, red spotting present on the upper surface of throat, limb reflexed, zygomorphic, ca. 0.5 cm wide, usually yellow, sometimes red, lobes nearly equal, ca. 5 mm long, ca. 3 mm wide, rotund, entire. Nectary gland single to shallowly bilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 1.9 cm long, adnate to base of corolla tube for ca. 7 mm, connate for 1 mm, forming an open sheath, glabrous; anthers 1.3 mm long, 2.6 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 5 mm long, ca. 4 mm wide, ovoid, densely pilose, style to 2.4 cm long, glabrous, stigma stomatomorphic. Mature fruit not seen. Fig. 34.

Phenology. Flowering throughout the year, collections of mature flowers dating from January to March, May, and December.

Distribution (Fig. 31). Eastern Andean slopes of Ecuador (Carchi, Morona-Santiago, Napo, Sucumbíos, Zamora-Chinchipe, and Tungurahua) and the southern Andes of Colombia (Antioquia, Nariño, and Putumayo); montane and premontane forests; 1500–3200 m.

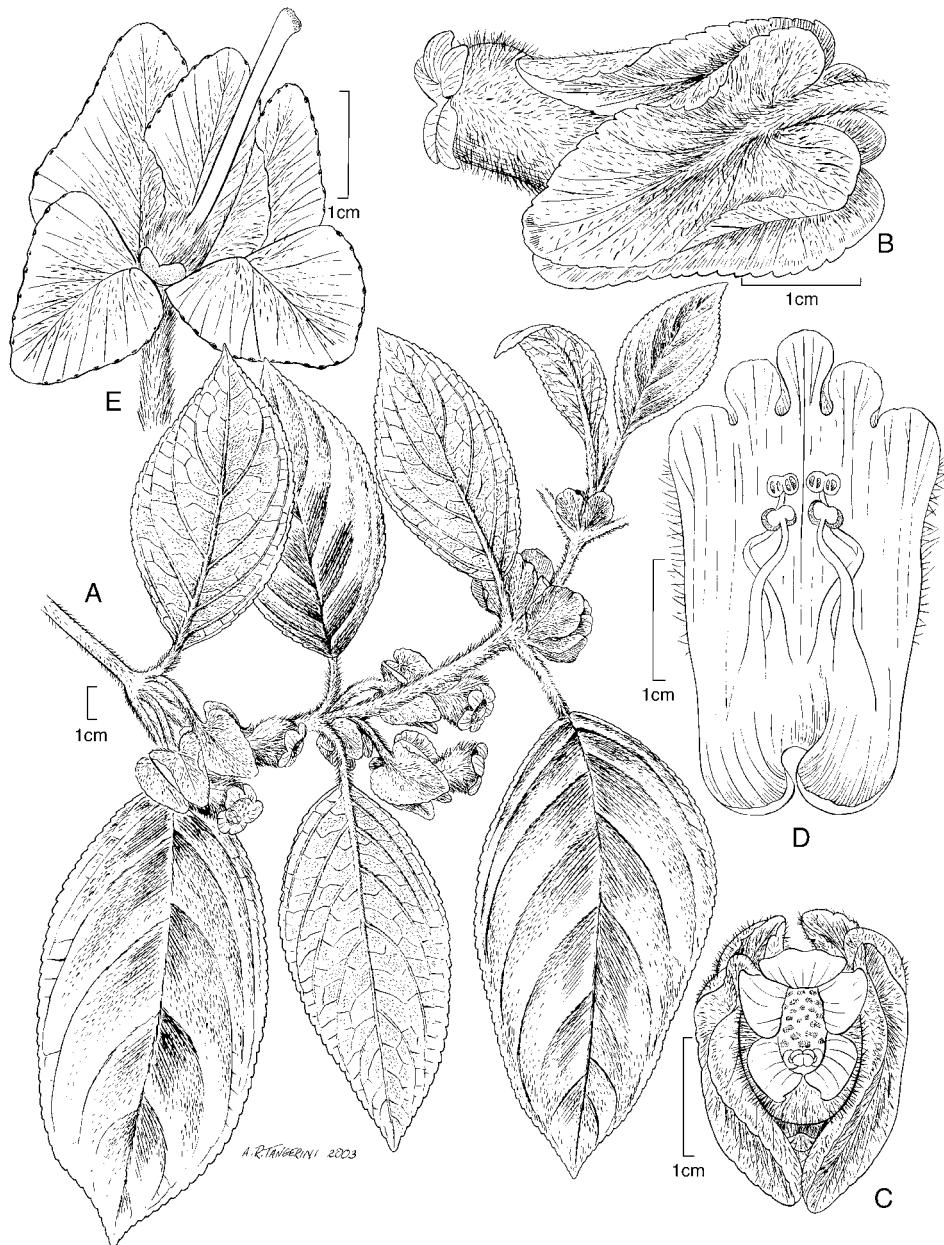

FIG. 34. *Glossoloma serpens*. A. Habit. B. Side view of flower. C. Face view of flower. D. Corolla opened to show stamens. E. Calyx opened and corolla removed to show pistil and bilobed nectary gland. (Based on: A-D, J. L. Clark et al. 5627; E, J. L. Clark et al. 5900). Reprinted with permission from *Novon* (Clark et al. 2005: Fig. 4).

Glossoloma serpens is characterized by an epiphytic habit, stems that are horizontal and not climbing, stout pedicels (1–3.5 cm long), and densely pilose corollas. This species is often collected on steep roadside embankments, where the nearly horizontal stems protrude like a serpent, hence the epithet. *Glossoloma serpens* is sometimes confused with *G. carpishense*, which differs in its ovate calyx lobes with an acuminate apex (Fig. 12); those of *G. serpens* are oblong with a rounded apex (Fig. 34). See also the discussion of *G. carpishense* (no. 6).

24. *Glossoloma sprucei* (Kuntze) J. L. Clark, Selbyana 25: 206. 2005. *Columnea sprucei*

Kuntze, Revis. gen. pl. 2: 471. 1891. *Crantzia sprucei* (Kuntze) Fritsch in Engler & Prantl, Nat. Pflanzenfam. 4(3b): 168. 1894. *Alloplectus sprucei* (Kuntze) Wiegler, Phytologia 27: 327. 1973. —TYPE: ECUADOR. Bolívar: El Limón on road from Guaranda to western lowlands, at the base of the mountain Chimborazo, ca. 900 m, Jun 1860, R. Spruce 6216 (holotype: K!; isotypes: BM! W; photo of W isotype: US!).

Herbs to subshrubs, terrestrial, rarely epiphytic; stems erect, unbranched, to 1 m tall, to 1 cm in diameter, subwoody, internodes 2–9 cm long, terete, glabrescent proximally, densely yellowish green woolly distally, leaf scars slightly raised from the stem surface, enations at base of petiole present. Leaves opposite, equal or subequal in a pair; petioles 5–15 cm long, strigose to pilose; blades 12–27 cm long, 8–20 cm wide, ovate, base rounded, apex acute, margin serrate, adaxially green, pilose, abaxially pale green, pilose, more pilose on venation, membranous when dry, lateral veins 6–8 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–4 flowers per node, posture pendent at anthesis, bracteoles broadly ovate, 15 mm long, 5 mm wide; pedicels shorter than the petiole, 1–2 cm long, densely pilose, pedicel enations absent. Calyx lobes nearly free, each appressed to adjacent lobe, folded lengthwise with the margin curved inward, erect, 4 equal, to 25 mm long, to 10 mm wide, broadly ovate, base truncate, apex attenuate, margins long-fimbriate with trichomes along border of enations, the teeth to 1.5 cm long and ca. 0.2 cm wide, greenish yellow or red, abaxially densely pilose, adaxially pilose; fifth (ventral) lobe smaller and narrower, to 1.5 cm long, 0.2–0.4 cm wide, lanceolate. Corolla to 6 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla oblique relative to calyx; base ca. 6 mm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat not constricted, appearing laterally compressed, to 1 cm wide (at mouth), outside glabrous at base, densely pilose distally, inside mostly glabrous, becoming glandular apically, red spotting present on the upper surface of throat, limb reflexed, zygomorphic, ca. 1.3 cm wide, usually yellow to orange-yellow, rarely red, lobes nearly equal, 6 mm long, 5 mm wide, rotund, entire. Nectary gland bilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 3 cm long, adnate to base of corolla tube for ca. 7 mm, connate for 1 mm, forming an open sheath, glabrous; anthers 2 mm long, 3 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 6 mm long, ca. 4 mm wide, ovoid, pilose, style 3.5 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent, ca. 1.5 cm long, ca. 1.4 cm wide, ovoid when immature, sparingly pilose, loculicidally dehiscent, becoming bivalved, valves reflexed, reaching a 180° angle when mature. Seeds numerous, 0.9 mm long, 0.3 mm wide, fusiform, longitudinally striate, brownish red. Fig. 35.

Phenology. Collected in flower from January to November, in fruit in January, March, May, July, August, and November.

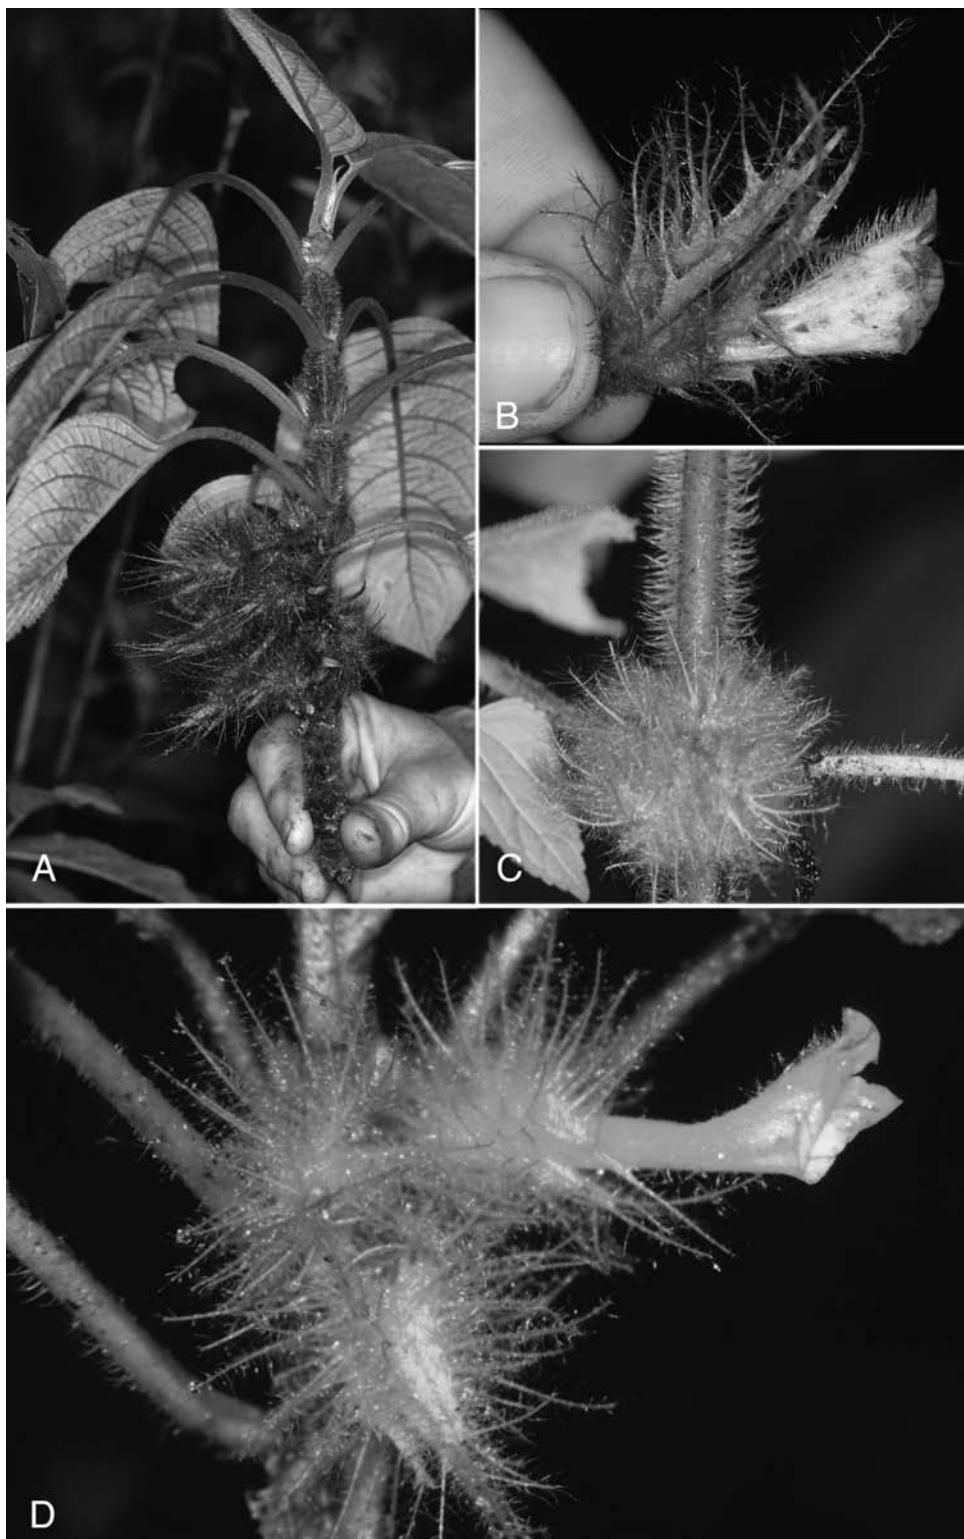

FIG. 35. *Glossoloma sprucei*. A. Habit. B. Lateral view of flower. C. Stem and immature calyces showing densely villous pubescence. D. Lateral view of flower. (Photos by J. L. Clark; vouchers: A, B, J. L. Clark & R. Hall 7581; C, J. L. Clark et al. 7488; D, J. L. Clark & A. Muñoz 6093.)

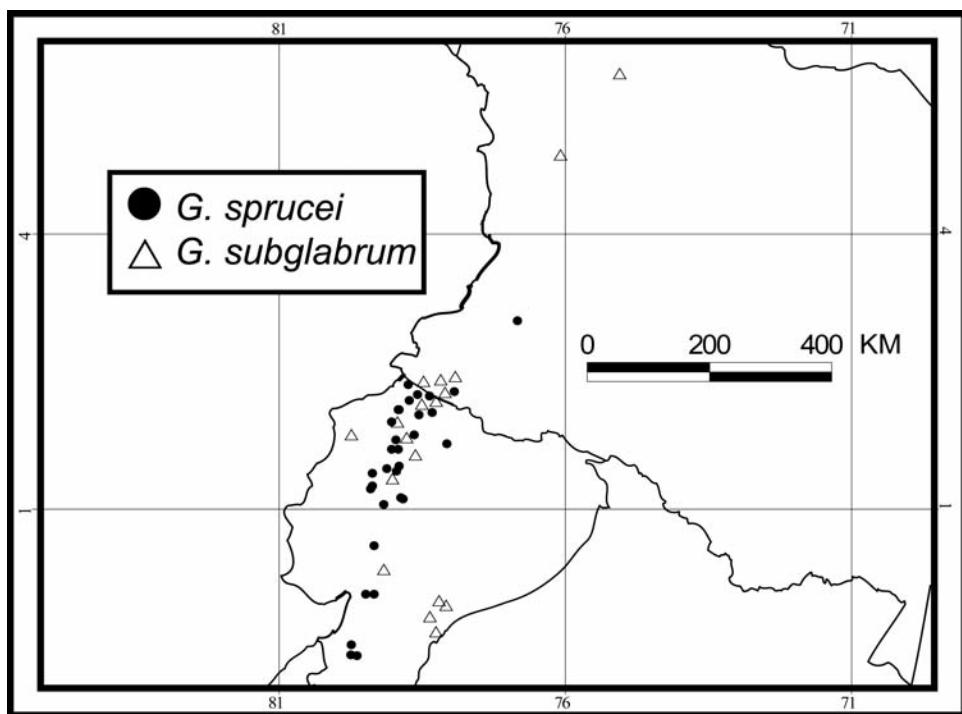

FIG. 36. Distribution of *Glossoloma sprucei* and *G. subglabrum* in Ecuador and Colombia.

Distribution (Fig. 36). *Glossoloma sprucei* is most commonly collected in Ecuador in the Northwestern lowlands and the eastern Andean slopes of Ecuador (Azuay, Bolívar, Carchi, Cotopaxi, Pichincha, El Oro, Esmeraldas, Imbabura, Los Ríos) and western Colombia (Cauca, Nariño); near streams, in shaded forests and shaded disturbed areas in montane and premontane forests; sea level to 1900 m.

Glossoloma sprucei is distinguished from its congeners by the following characters: broadly ovate leaf blades with a cordate base, fimbriate calyx margins, resupinate flowers, and an unbranched terrestrial habit. Three other species of *Glossoloma* with fimbriate calyx lobes are *G. medusaeum*, *G. purpureum*, and *G. anomalam*. The first two are also similar to *G. sprucei* in having resupinate flowers, but differ in their elliptic to oblong leaves. The flowers of *G. anomalam* are not resupinate (Fig. 8), and the corollas are shorter (< 2.5 cm long) than those of *G. sprucei* (to 6 cm; Fig. 35).

The sheet of *Spruce* 6216 at K is the only duplicate of the type collection of *G. sprucei* that is annotated by Kuntze and is therefore considered the holotype.

25. *Glossoloma subglabrum* J. L. Clark, sp. nov.—TYPE: ECUADOR. Carchi: Cantón Espejo, Parroquia Guatal, Mirador de las Golondrinas (Fundación Golondrinas), trail from Santa Rosa (El Rosal) to the refugio at El Corazón, 00°23'09"S, 78°10'01"W, 1600–2000 m, 5 Jul 2003, *J. L. Clark, S. G. Clark, E. Folleco & B. Syka* 8448 (holotype: US!; isotypes: AAU! COL! E! K! MO! NY! QCA! QCNE! SEL! UNA!).

G. panamensi simile sed foliis subglabris et venis numerosis (9–14 vs. 6–8) valde differt.

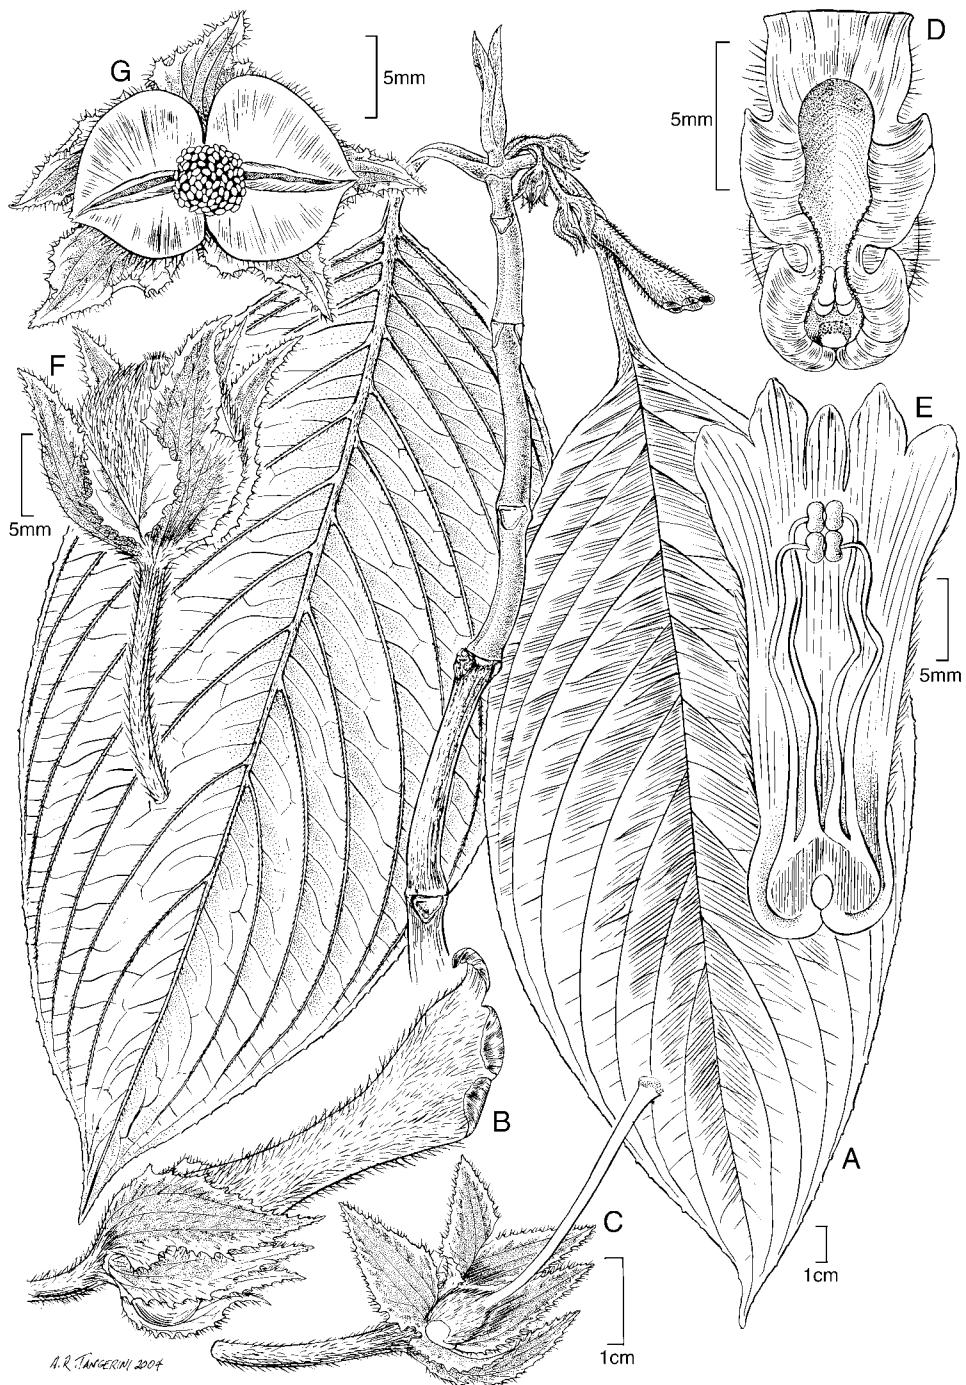

FIG. 37. *Glossoloma subglabrum*. A. Habit. B. Side view of flower. C. Calyx opened and corolla removed to show bilobed nectary gland and pistil. D. Face view of flower. E. Corolla opened to show stamens. F. Immature fruit. G. Mature fruit. (Based on J. L. Clark et al. 8448, holotype).

Subshrubs, terrestrial; stems erect, unbranched, to 2 m tall, to 1.5 cm in diameter, woody, internodes 3–13 cm long, subquadrangular, glabrous, leaf scars slightly raised from the stem surface, enations at base of petiole present. Leaves opposite, equal or subequal in a pair; petioles 3–10 cm long, puberulous; blades 18–30 cm long, 10–19 cm wide, ovate to oblong, base rounded, apex acute, margin serrulate, adaxially dark green, glabrous, abaxially pale green, occasionally with red tinge, glabrous, sometimes puberulous on venation, subcoriaceous when dry, lateral veins 9–14 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–4 flowers per node, posture pendent at anthesis, bracteoles 15–20 mm long, 5 mm wide, lanceolate; pedicels shorter than the petiole, 1–2.5 cm long, glabrous to pilose, pedicel enations present. Calyx lobes nearly free, each appressed to adjacent lobe, folded lengthwise with the margin curved inward, occasionally plane and valvate, erect, nearly equal, to 20 mm long, to 6 mm wide, broadly oblong to ovate, base truncate, apex acute, margin serrate, light red to maroon, abaxially villous, adaxially pilose. Corolla to 5 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla oblique relative to calyx; base ca. 5 mm in diameter, middle slightly ampliate to uniformly tubular, throat not constricted, appearing laterally compressed, 6–8 mm wide, outside glabrous at base, sparingly to densely pilose distally, inside mostly glabrous, becoming glandular apically, interior spotting absent, limb reflexed, zygomorphic, to 1 cm wide, uniformly red, lobes nearly equal, 4 mm long, 6 mm wide, rotund, entire. Nectary gland bilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 2 cm long, adnate to base of corolla tube for ca. 5 mm, connate for 1 mm, forming an open sheath, glabrous; anthers 1 mm long, 1.5 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 6 mm long, ca. 4 mm wide, ovoid, densely pilose, style 3 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent, ca. 2 cm long, ca. 1.5 cm wide, ovoid when immature, sparingly pilose, loculicidally dehiscent, becoming bivalved, valves reflexed, reaching a 180° angle when mature. Seeds numerous, 1 mm long, 0.3 mm wide, fusiform, longitudinally striate, brownish red. Fig. 37.

Phenology. Collected in flower throughout the year, in fruit in August, September, and December.

Distribution (Fig. 36). Eastern and western slopes of the Ecuadorian Andes, and the Cordillera Oriental (Chocó, Nariño, Risaralda, and Valle del Cauca) and Cordillera Central (Antioquia) of Colombia; shaded primary and disturbed moist to pluvial wet forests; 200–2000 m.

Glossoloma subglabrum is distinctive in its nearly glabrous stems and leaves, which separate it from the similar *G. panamense*; the latter has pilose stems and hispid leaves,

and is only rarely collected where the two species overlap, in the Chocó floristic region of northwestern Ecuador and southwestern Colombia.

- 26. *Glossoloma tetragonoides* (Mansfeld) J. L. Clark, Selbyana 25: 207. 2005. *Alloplectus tetragonoides* Mansfeld, Biblioth. Bot. 116: 144. 1937.—TYPE: ECUADOR. Tungurahua: area of Río Pastaza and Río Topo, 01°23'09"S, 78°10'01"W, 1200 m, 12 Sep 1933, L. Diels 1002 (B, destroyed).—ECUADOR. NY! QCA! S! SEL! US!).**

Herbs to subshrubs, terrestrial; stems erect, unbranched, to 2 m tall, 1 cm in diameter, succulent, becoming woody, internodes 3–12 cm long, subquadangular, usually glabrescent, sometimes sparsely pubescent distally, leaf scars raised from stem surface, enations at base of petiole present. Leaves opposite, equal or subequal in a pair; petioles 2–12 cm long, sparsely to densely pilose; blades 9–39 cm long, 3.5–24 cm wide, usually elliptic, sometimes ovate, base acute, apex acute, margin shallowly serrate, adaxially green, sparsely pilose, abaxially all green, all red, or green with red tinge, sparsely to densely pilose (especially on young foliage), subcoriaceous when dry, lateral veins 6–8 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–4 flowers per node, posture pendent at anthesis, bracteoles 3 cm long, 1.5 cm wide, broadly ovate; pedicels shorter than the petiole, 1–5 cm long, glabrous to pilose, pedicel enations absent. Calyx lobes nearly free, each appressed to adjacent lobe, folded lengthwise with the margin curved inward, erect, 4 equal, 1.5–2.5 cm long, 1.0–2.0 cm wide, ovate, base truncate to slightly cordate, apex acute to acuminate, margin serrate, all green, all red, red with green margins, or green with red margins, abaxially sparsely pilose to hirsute, midvein especially pilose, adaxially glabrous except pilose at base; fifth (ventral) lobe smaller and narrower, to 25 mm long, to 18 mm wide, narrowly oblong. Corolla 2.5–6.0 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla oblique relative to calyx; base 3–5 mm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat appearing laterally compressed, 1.0–1.5 cm wide (at mouth), outside sparsely pilose, becoming more pilose distally, inside mostly glabrous, becoming glandular apically, interior spotting absent, limb spreading, zygomorphic, 1.5 to 2.0 cm wide, red, yellow, or yellow with red lobes, lobes nearly equal, 3.0–4.5 mm long, 5–8 mm wide, rotund, entire. Nectary gland bilobed or single-lobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 3 cm long, adnate to base of corolla tube for 4 mm, connate for 1 mm, forming an open sheath, glabrous; anthers ca. 2.0 mm long, ca. 2.5 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 7 mm long, ca. 5 mm wide, ovoid, densely pilose, style 5 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent when ripe, ca. 1.3 cm long, ca. 1 cm wide, ovoid when immature, pilose, loculicidally dehiscent, becoming bivalved, valves reflexed, reaching a 180° angle when mature. Seeds numerous, ca. 1 mm long, ca. 0.2 mm wide, fusiform, longitudinally striate, yellow. Fig. 38.

Phenology. Collected in flower throughout the year, in fruit in January, February, August, and September.

Distribution (Fig. 39). Eastern Andean (Pastaza, Tungurahua, Napo, Morona-Santiago) to western Andean slopes of Ecuador (Pichincha, Esmeraldas), western slopes of the Colombian Cordillera Occidental (Nariño, Chocó) and the Cordillera Central

Glossoloma tetragonoides is highly variable and often confused with other species. The undersurface of the leaves can be uniformly green to green with a reddish tinge to uniformly red. Calyces can be green or red, and corollas completely yellow, completely red, or yellow with red lobes. It is common to find individuals with green calyces and yellow corollas with red lobes growing sympatrically with individuals that have uniformly red corollas. The most useful character in differentiating *G. tetragonoides* from similar

species, such as *G. tetragonum* and *G. grandicalyx*, is its smaller calyx (1.5–2.5 cm long) with lobes having serrate margins (Fig. 38D). The calyx of *G. tetragonum* is up to 3.0 cm long and lobe margins are dentate (Fig. 40E); that of *G. grandicalyx* is up to 4 cm long.

Alloplectus fraternus C. V. Morton, Proc. Biol. Soc. Wash. 69: 193. 1956.—TYPE: PANAMA. Chiriquí: flat areas on the slopes of Volcán de Chiriquí Viejo and along Río Chiriquí Viejo, 1200 m, 20 Apr 1935, Allen 1000 (holotype: MO!, fragment: US!; isotypes: BM! BR! F! G! U!).

Herbs to subshrubs, terrestrial; stems erect, unbranched, to 2 m tall, to 1.5 cm in diameter, succulent, becoming woody, internodes 2–15 cm long, subquadrangular, glabrescent proximally, hirsute with yellowish hairs distally, leaf scars raised from stem surface, enations at base of petiole present. Leaves opposite, equal or subequal in a pair; petioles 5–13 cm long, sparsely to densely pilose; blades 14–25 cm long, 4–11 cm wide, narrowly elliptic to oblong, base cuneate or acute, apex acute, margin serrate or serrulate, adaxially green, sparsely pilose especially on the veins, abaxially pale green, strigose or hirsute, subcoriaceous when dry, lateral veins 6–8 per side. Inflorescence not pedunculate, flowers appearing fasciculate, resupinate, with 1–4 flowers per node, posture pendent at anthesis, bracteoles ca. 10 mm long, 5 mm wide, broadly ovate; pedicels shorter than the petiole, 2–5 cm long, pilose, pedicel enations absent. Calyx lobes connate briefly at base, each appressed to adjacent lobe, folded lengthwise with the margin curved inward, erect, subequal, to 30 mm long, to 25 mm wide, broadly ovate, base cordate, apex acute to acuminate, margin dentate to serrate, all green, all red, orange, or green with red margins, abaxially hirsute with the midvein especially densely pilose, adaxially hirsute to glabrous. Corolla 3.5–6.0 cm long, tubular, gibbous basally on lower surface, spur absent, long axis of corolla oblique relative to calyx; base ca. 4 mm in diameter, middle ampliate, becoming apically ventricose on upper surface, throat not constricted, appearing laterally compressed, 1.5 cm wide (at mouth), outside pilose, inside glabrous, interior spotting absent, limb spreading, zygomorphic, ca. 1.5 cm wide, red or appearing orange or yellow from dense yellow hairs, lobes nearly equal, ca. 3 mm long, 3–6 mm wide, rotund, entire. Nectary gland bilobed, on ventral surface of ovary, glabrous. Filaments coiling after anthesis, free portion to 3 cm long, adnate to base of corolla tube for 5 mm, connate for 1 mm, forming an open sheath, glabrous; anthers ca. 2 mm long, ca. 3 mm wide, dehiscing by longitudinal slits; staminode absent. Ovary ca. 6 mm long, ca. 4 mm wide, ovoid, densely pilose, style 3 cm long, glabrous, stigma stomatomorphic. Fruit a fleshy capsule, pendent when ripe, ca. 1.3 cm long, ca. 1 cm wide, ovoid when immature, pilose, loculicidally dehiscent,

becoming bivalved. Seeds numerous, 0.5–1 mm long, ca. 0.2 mm wide, fusiform, longitudinally striate, dark brown. Fig. 40.

Phenology. Collected in flower and fruit throughout the year.

Distribution (Fig. 39). Southern Costa Rica, Panama, and Colombia (Antioquia, Valle del Cauca, Nariño, Huila, and Cauca); shaded primary and disturbed, moist to pluvial wet forests; 100–2000 m.

Glossoloma tetragonum is distinguished by its unfolded and plane calyx lobes with a serrate margin. The similar and partly sympatric *G. cucullatum* has hooded or cucullate calyx lobes. The ranges of these two species overlap only in northern Costa Rica.

Glossoloma tetragonum is morphologically diverse. The calyx lobes range from oblong to ovate (Fig. 40B, E). The leaves vary from uniformly green to green with a reddish tinge to uniformly red. A few populations of *G. tetragonum* are distinctive and may merit subspecies delineation upon further study. A population (3–5 collections) on the Pacific slopes of the Cordillera de Guanacaste in northwestern Costa Rica is distinctive in having narrowly oblong calyx lobes. Initially, this seemed to be a consistent character for populations of this region, but there is a gradation between narrowly oblong to ovate calyx lobes within some populations and sometimes within individuals. For example, *Herrera* 1434 (US) from the Volcán Santa María in the Parque Rincón de La Vieja has both narrowly oblong and ovate calyx lobes on the same individual. Another population (3+ collections) from Antioquia, Colombia, has uniformly red leaves that are narrowly oblong and calyx margins that are entire. A third population (10+ collections) from Veraguas in Panama has narrowly oblong leaves that are uniformly green abaxially and green calyces. Since these characters are usually variable over the full range, the populations noted here are not separated taxonomically.

Hanstein (1854) published *Glossoloma* as a new genus, containing one species, *G. tetragonum*, in the first part of his account of the family Gesneriaceae; in synonymy he cited the unpublished name *Nematanthus tetragonous* Oerst. and provided an accompanying illustration of two flowers. In a subsequent detailed treatment of the tribe Beslerieae, Hanstein (1865) transferred this species to *Alloplectus*; from his remarks it is evident that at the time that he published *Glossoloma*, he relied on Oersted's unpublished manuscript from which he drew the brief description in the protologue and copied the images of the two flowers. Oersted's description and plate were based on one of his collections from Costa Rica, *Oersted* 9275 (now at C), which is therefore the holotype. Although Hanstein is usually credited with the genus *Glossoloma*, the species *G. tetragonum* has been attributed to Oersted on herbarium labels and by some authors (Wiehler 1973; Skog 1979), including Hanstein (1865) when he proposed the combination *Alloplectus tetragonous*. Oersted (1861) indeed provided the first full description for the species; however, according to

Article 42.1 of the Code (McNeill et al. 2006) the names of a genus and a species are validly published simultaneously, if the genus is at that time monotypic.

EXCLUDED NAME

Besleria solitaria C. V. Morton ex Espinosa, Gesneriaceae in *Estudios Botánicos en el Sur del Ecuador* 2: 76. 1949 [Herbarium Universitatis Loxensis, Loja, Ecuador], nomen nudum [*Glossoloma altescandens*].

ACKNOWLEDGMENTS

Special thanks are due to Laurence E. Skog and Patrick S. Herendeen for advice and encouragement in preparing this revision and acting as my mentors throughout my tenure as a Ph.D. student. This monograph is based on part of a doctoral dissertation submitted to the George Washington University. I am grateful to Elizabeth F. Wells, Vicki Funk, Elizabeth Zimmer, and Marc Allard for reviewing the manuscript and for participating on my Ph.D. committee. I also thank Alain Chautems, James Smith, and Christiane Anderson for their careful review and comments on the manuscript. This study was supported by funds from the National Science Foundation (grant DEB-0206512 to George Washington University, Patrick S. Herendeen and John L. Clark; grant DEB-0841958 to the University of Alabama, John L. Clark), the American Gloxinia and Gesneriad Society, the Explorers Club Washington Group, the George Washington University Chapter of the Society of Sigma Xi, the José Cuatrecasas Botanical Fund of the Department of Botany, U.S. National Museum of Natural History, Cosmos Club Foundation - grants-in-aid to Scholars, American Society of Plant Taxonomy Graduate Research Award, and a Fulbright Graduate Study and Research Abroad Scholarship. Initial fieldwork was conducted while serving as a U.S. Peace Corps Volunteer in Ecuador with the Jatun Sacha Foundation and the National Herbarium of Ecuador. I also extend my thanks and appreciation to a number of people for assistance on specific aspects of the project, including John Boggan (database work and helpful discussions), Tom Hollowell (distribution maps), Dan Nicolson (botanical nomenclature), Harold Robinson and William R. Anderson (Latin diagnoses), Christian Feuillet (translations), David Neill (field work in Ecuador), and Cathy Pasquale-Johnson, Alice Tangerini, Willilam Farfán Ríos, and Brittany Walla for preparing illustrations of the new species. I am grateful to the curators of the following herbaria for making their material available for this study: A, AAU, BOLV, BM, BR, C, CAS, COL, DAV, E, F, G, GH, GOET, GUAY, HA, K, LE, LOJA, LPB, MA, MO, MT, MTJB, NY, P, PH, PMA, PORT, Q, QCA, QCNE, QPLS, S, SCZ, SEL, U, UC, ULM, US, USM, and VEN).

NUMERICAL LIST OF TAXA

- | | |
|------------------------------|-----------------------------|
| 1. <i>G. altescandens</i> | 15. <i>G. oblongicalyx</i> |
| 2. <i>G. anomalum</i> | 16. <i>G. panamense</i> |
| 3. <i>G. baguense</i> | 17. <i>G. pedunculatum</i> |
| 4. <i>G. bicolor</i> | 18. <i>G. penduliflorum</i> |
| 5. <i>G. boliviannum</i> | 19. <i>G. purpureum</i> |
| 6. <i>G. carpishense</i> | 20. <i>G. pycnosuzygium</i> |
| 7. <i>G. chrysanthum</i> | 21. <i>G. scandens</i> |
| 8. <i>G. cucullatum</i> | 22. <i>G. schultzei</i> |
| 9. <i>G. grandicalyx</i> | 23. <i>G. serpens</i> |
| 10. <i>G. harlequinoides</i> | 24. <i>G. sprucei</i> |
| 11. <i>G. herthae</i> | 25. <i>G. subglabrum</i> |
| 12. <i>G. ichthyoderma</i> | 26. <i>G. tetragonoides</i> |
| 13. <i>G. martinianum</i> | 27. <i>G. tetragonum</i> |
| 14. <i>G. medusaeum</i> | |

INDEX TO NUMBERED COLLECTIONS EXAMINED

The numbers in parentheses refer to the corresponding species in the text and in the Numerical List of Species presented above.

INDEX TO SCIENTIFIC NAMES

Accepted names are in roman type; the main entry for each is in **boldface**. Synonyms are in *italics*.

- Acanthaceae 12
Alloplectus Mart. 1, 2, 3, 4, 5, 6, 7, 13, 113
altescandens Mansf. 16
aquatilis 8
baguensis L. E. Skog 22
bicolor (Kunth) G. Don 25
boliviensis (Britton ex Rusby) Wiehler 26
carpishensis J. L. Clark & I. Salinas 28
chrysanthus Planch. & Linden 31
cucullatus C. V. Morton 33
 var. *substrigosus* C. V. Morton 33
fraternus C. V. Morton 108
glabrescens C. V. Morton 82
grandicalyx J. L. Clark & L. E. Skog 37
herthae Mansf. 42
hispidum (Kunth) Mart. 3, 8
ichthyoderma Hanst. 47
 var. *hirsutulus* C. V. Morton 108
 var. *pallidus* C. V. Morton 48
 f. *rubescens* C. V. Morton 48
kunthii G. Don 25
martinianus J. F. Smith 57
medusaeus L. E. Skog 59
meridensis Klotzsch ex Hanst. 47, 57
oblongicalyx J. L. Clark & L. E. Skog 64
ornatus C. V. Morton 31
panamensis C. V. Morton 67
penduliflorus M. Freiberg 76
purpureus L.P. Kvist & L. E. Skog 79
pycnosuzygius (Donn. Sm.) C. V. Morton 82
ruacophilus Donn. Sm. 47
schultzei Mansf. 87
serpens J. L. Clark & L. E. Skog 92
simulatus C. V. Morton 108
sprucei (Kuntze) Wiehler 95
tessmannii 8
tetragonoides Mansf. 103
tigrinus Karst. 19
tetragonus (Hanst.) Hanst. 108
varelanus (Cuatrec.) Cuatrec. 48
weiri 8
Besleria L.
 bicolor Kunth 25
horizontalis C. V. Morton 42
pycnosuzygia Donn. Sm. 82
solitaria C. V. Morton ex Espinosa 114
Beslerieae 113
Calanthis Oerst. 2
Cobonanthus Wiehler 3
Codonanthe (Mart.) Hanst. 4
Columna L. 1, 3, 4, 5, 6, 7, 8, 14, 59, 73
 sect. *Pentadenia* 10
 bicolor (Kunth) Kuntze 25
boliviiana Britton ex Rusby 26
calotricha Donn. Sm. 85
chrysantha (Planch. & Linden) Kuntze 31
formosa (C. V. Morton) C. V. Morton 59
ichthyoderma (Hanst.) Kuntze 47
meridensis (Klotzsch ex Hanst.) Kuntze 47
oerstediana Klotzsch ex Oerst. 85
sprucei Kuntze 95
spathulata Mansf. 56
strigosa Benth. 10
tetragona (Hanst.) Kuntze 108
Coronanthereae 4
Coronantheroideae 4
Corytoplectus
 speciosus (Poepp.) Wiehler 3
Crantzia Scop. 1, 3, 4, 5, 6, 7, 19, 22
 bicolor (Kunth) Fritsch 25
ichthyoderma (Hanst.) Fritsch 47
sprucei (Kuntze) Fritsch 95
tetragona (Hanst.) Fritsch 108
vareiana Cuatrec. 48
Drymonia Mart. 1, 3, 4, 5, 6, 7, 8, 13, 14
 coccinea (Aubl.) Wiehler 3, 76
collegarum 13
ecuadorensis Wiehler 9
serrulata (Jacq.) Mart. 12
Episcia Mart. 4
Episciae 1, 2, 4, 5, 8, 9, 76
Erythranthus Oerst. 2
Gesneriaceae 1, 2, 4, 5, 9, 12, 73, 76, 85, 113
Gesnerioideae 1, 4
Glossoloma Hanst. **14**
 altescandens (Mansf.) J. L. Clark 8, 9, 12, 15, **16–19**, 114, 116
 anomalum J. L. Clark 1, 5, 8, 10, 11, 14, 15, 19, **20–22**, 57, 63, 64, 81, 99, 116
 baguense (L. E. Skog) J. L. Clark 8, 9, 11, 12, 13, 16, 19, **22–25**, 116
 bicolor (Kunth) J. L. Clark 2, 5, 11, 16, 19, **25**, 57, 116
 boliviianum (Britton ex Rusby) J. L. Clark 8, 10, 12, 15, 16, **26–28**, 33, 47, 77, 116
 carpishense (J. L. Clark & I. Salinas) J. L. Clark 8, 15, **28–31**, 95, 116
 chrysanthum (Planch. & Linden) J. L. Clark 7, 8, 15, 28, **31–33**, 116
 cucullatum (C. V. Morton) J. L. Clark 2, 5, 10, 14, 16, **33–37**, 113, 116
 grandicalyx (J. L. Clark & L. E. Skog) J. L. Clark 8, 12, 16, 36, **37–40**, 42, 57, 67, 92, 108, 116
 harlequinoides J. L. Clark 1, 8, 11, 12, 16, 36, **40–42**, 57, 73, 116

- herthae (Mansf.) J. L. Clark 8, 9, 14, 15, 23, 28, 33, **42–47**, 77, 84, 116
ichthyoderma (Hanst.) J. L. Clark 7, 8, 9, 11, 12, 14, 16, 25, 31, 45, **47–56**, 116
martinianum (J. F. Smith) J. L. Clark 8, 9, 11, 12, 14, 15, 17, 45, 57, **57–59**, 116
medusaeum (L. E. Skog) J. L. Clark 8, 12, 14, 16, **59–64**, 81, 82, 99, 116
oblongicalyx (J. L. Clark & L. E. Skog) J. L. Clark 8, 16, 39, 40, 62, **64–67**, 116
panamense (C. V. Morton) J. L. Clark 8, 9, 11, 13, 14, 16, 62, **67–73**, 76, 92, 102, 116
pedunculatum J. L. Clark 1, 8, 9, 11, 15, **73–76**, 116
penduliflorum (M. Freiberg) J. L. Clark 7, 8, 9, 10, 15, 75, **76–79**, 87, 116
purpureum (L. P. Kvist & L. E. Skog) J. L. Clark 8, 9, 10, 11, 15, 63, 64, 75, **79–82**, 99, 116
pycnosuzygium (Donn. Sm.) J. L. Clark 7, 8, 10, 13, 15, 47, **82–85**, 116
scandens J. L. Clark 7, 8, 15, 77, 84, **85–87**, 116
schultzei (Mansf.) J. L. Clark 7, 8, 9, 10, 16, 84, **87–92**, 116
serpens (J. L. Clark & L. E. Skog) J. L. Clark 8, 12, 15, 31, 84, **92–95**, 116
sprucei (Kuntze) J. L. Clark 8, 9, 10, 16, 63, 81, **95–99**, 116
subglabrum J. L. Clark 1, 8, 9, 11, 16, 73, 97, **99–103**, 116
tetragonoides (Mansf.) J. L. Clark 8, 12, 13, 16, 39, 40, 42, 67, 92, **103–108**, 116
tetragonum Hanst. 1, 3, 4, 8, 12, 14, 16, 36, 67, 105, **108–114**, 116
Gloxineae 9
Heintzia Karst. 2
Kohleria Regel 22
Lampadaria Feuillet & L. E. Skog 1
Nautilocalyx Linden ex Hanst. 2, 4
Nematanthus Schrad. 1, 2, 3, 4, 5, 6, 11, 22
lanceolatus (Poir.) Chautems 3
tetragonus Oerst. 4, 113
Neomortonia
nummularia 8
rosea 8
Paradrymonia Hanst. 2, 4, 5
Sinningia 8
Sinningieae 9
